(54) Title: ELECTRONIC BARTERING SYSTEM WITH FACILITATING TOOLS

(57) Abstract: A bartering system implements barter between a plurality of parties each having one or more classes of items available for barter. Preferably, barter orders are created by designating a selected quantity of a first class of items to be bartered, designating a date range for transferring title of the first class items to be bartered, designating a barter value of the first class of items to be bartered, and designating a second class of items to be acquired. Barter orders are posted via the Internet to a barter database and may be displayed via the Internet. Posted barter orders whose first class of items match the second class of items of a barterer's order are preferably displayed. Posted barter orders from the display are selected to effectuate a barter transaction which combines a barterer's barter order with the selected posted order(s). Toolkits are provided for enabling parties, particularly marketmakers, to respond to barter orders in an automated manner. Marketmaker toolkits to populate a database, or order book, with barter

orders, which can be traded against by traders. Other toolkits are provided for enabling traders to establish barter orders grouped in baskets based on market fundamentals and risk characteristics. Still other toolkits are provided for enabling retail traders to establish contingent barter orders, or barter orders that are only processed upon the occurrence of a specified condition.

ELECTRONIC BARTERING SYSTEM WITH FACILITATING TOOLS

RELATED APPLICATIONS

This application claims priority to U.S. Provisional Patent Application No. 60/271,541 filed February 26, 2001, U.S. Patent Application No. 09/454,035 filed 12/03/99, U.S. Provisional Patent Application No. 60/161,318, filed October 25, 1999, U.S. Provisional Patent Application No. 60/153,142, filed September 9, 1999, and U.S. Provisional Patent Application No. 60/147,243, filed August 5, 1999, each being herein incorporated by reference.

FIELD OF THE INVENTION

The present invention relates to systems and methods for facilitating the trading of items or securities and more particularly to systems and methods for facilitating the electronic bartering of items or securities.

BACKGROUND

Automated computer systems matching buy and sell orders for trading stocks, futures and other properties are well known in the art. An example of such a system is shown in U.S. Patent No. 3,573,747 to Adams, et al., which discloses a system for matching buy and sell orders for fungible properties between traders. After the initial match, one embodiment of this system allows traders to negotiate other terms of the transaction while all traders are continuously apprised of the negotiation status. A system disclosed in U.S. Patent No. 4,412,287 to Braddock relates to trading stock and discloses a central computer that matches buy and sell orders from a plurality of user terminals. U.S. Patent No. 5,689,652 to Lupien, et al. shows a computer network with a plurality of trader terminals that matches buy and sell orders incorporating a satisfaction density profile. The density profile provides a measure for maximizing the mutual satisfaction of all traders.

Computer systems to match bids and offers are also well known in the art. A system disclosed in U.S. Patent No. 4,903,201 to Wagner matches bids and offers for future commodity contracts and detects illegal trade practices. U.S. Patent No. 5,727,165 to Ordish, et al., discloses a network system and further provides confirmation timing and notification messaging to traders. In U.S. Patent No. 5,924,082 to Silverman, et al., a negotiated matching system is shown which matches bids and offers based on a criteria that includes "ranking" data. The ranking data is comprised of credit and risk information to facilitate the best matches with respect to risk management. Another aspect of this system permits traders to negotiate directly with each other prior to or after an initial match is made by the system. The system of U.S. Patent No. 5,926,801 to Matsubara et al. also matches bids and offers, and in one embodiment, credit criteria is considered in the match.

A computer system disclosed in U.S. Patent No. 5,873,071 to Ferstenberg, et al. includes an intermediary computer program and an electronic agent computer program which can operate over the Internet. The intermediary computer program mediates offers and counter-offers for financial commodities. Goals, expressed as either a set of computer rules or as an objective with constraints, are set by the participants and the electronic agent computer program generates counter-offers according to the goals in response to offers from the intermediary computer program. In one embodiment of the system, a calculated "fairness measure" is used to determine satisfaction of the participants goals.

None of these patents address a bartering, exchanging or selling system whereby an individual trader constructs a barter order by establishing trading parameters that include an item to be bartered and a desired item to be received. Accordingly, none of these systems characterize potential barter exchanges in a quantifiable manner for an individual trader. The known electronic systems also fail to provide a means for assisting traders in the selection of trading items from that trader's portfolio of financial instruments.

SUMMARY OF THE INVENTION

The present invention relates to a computer-based system for bartering, exchanging or selling, (hereinafter referred to as bartering), items or securities including but not limited to,

stock, cash (foreign or domestic currencies), web barter dollars (defined below), Himmelstein Options (defined below), CD's, bonds, notes, Option Put, Option Call, Commodities/Futures, Annuities, Muni Bond(s), Government Bonds, Funds, Strips (Zero Coupon Treasuries), Ginnie Mae(s), Fannie Mae(s), Freddie Mac(s), UIT (Unit Investment Trust), T-bills and any future created or defined security, commodity or commodity money wherein a barter order indicating the item to barter and the desired barter item are matched by the website. Barter transactions are made which combine a barterer's barter order with a matching order or combination of orders which the barterer selects or the barterer has automatically selected by the website. Barter transactions can incorporate agreements. One agreement, termed a Himmelstein Option, permits barterers to agree to a future range of dates: a date after the barter transaction may occur and a date before the barter transaction must occur or the rights of ownership may expire. These dates may be the same. The before date may be indefinite. Himmelstein's Options (i.e. the portion of the barter transaction that is to be acquired) may be sold for cash or bartered (i.e. assign their rights or transfer their rights for a different security). In other words, the Himmelstein Option agreement, once acquired may be assigned without the written consent of the issuer/creator. This means that acquirer may transfer his rights to acquire the security or other item, which is the subject of a Himmelstein Option to someone else. Himmelstein options also include other conditions or parameters in the agreement as well.

The electronic bartering system of the present invention includes tools for facilitating the function of the system users. Provided with the present invention are toolkits for market makers to set automated and manual trading rules, toolkits for market makers to generate customized stock trade ticker lists and profit and loss statements, and toolkits for users to establish basket and contingency barter orders.

BRIEF DESCRIPTION OF THE DRAWINGS

Figure 1 is a diagram of a bartering system in accordance with the teachings of the present invention.

Figure 2 is a schematic diagram of the structure of an example barter database and barter order in accordance with the teachings of the present invention.

Figure 3 is a schematic diagram of a multi-order barter transaction in accordance with the teachings of the present invention.

Figures 4A-4E are flowcharts of a typical barter ordering session and barter transaction in accordance with the teachings of the present invention.

Figures 5A-5F are portions of screen displays illustrating the creation of a sample barter order in accordance with the teachings of the present invention.

Figure 6 is an example of a barter transaction screen in accordance with the teachings of the present invention.

Figures 7A-7E are schematic illustrations of several different types of barter transactions which may be implemented according to the teachings of the present invention.

Figure 8 is a schematic diagram of the components of a barter posting module in accordance with the teachings of the present invention.

Figures 9A and 9B are tables illustrating general and specific parameters for classes of barter items that are preferably utilized in a barter system made using a Himmelstein Option in accordance with the teachings of the present invention. Specifically, the "barter/settlement date, open/close" column in the tables is a condition or parameter included in the Himmelstein Option.

Figure 67 is a copy of a graphical user interface for a computer screen, accessible through graphical user interface Figure 54, by which a user can create a customized position/profit and loss report;

Figures 68 and 69 are copies of computer screens illustrating exemplary position/profit and loss reports established using the graphical user interface of Figure 67;

Figure 70 is a copy of a user help request screen for use by a user in interpreting the GUI of Figure 67;

Figure 71 is a copy of a graphical user interface for a computer screen, accessible through the graphical user interface of Figure 54, by which a marketmaker can create a manual offer;

Figure 72 is a copy of a graphical user interface for a computer screen, accessible through the graphical user interface of Figure 71, by which a user can edit manual offer default criteria;

Figure 73 is a copy of a user help request screen for use by a user in interpreting the GUIs of Figures 71 and 72;

Figure 74 is a copy of a graphical user interface for a computer screen, accessible through the graphical user interface of Figure 54, by which a user can view symbols used in creating rules and by which a user can create new symbols used in creating rules; and

Figures 75 and 76 are copies of user help request screens for use by a user in interpreting the GUI of Figure 74.

DETAILED DESCRIPTION OF THE INVENTION

The present invention will be described with reference to the drawing figures where like numerals represent like elements throughout.

The Himmelstein Option is a new type of financial interest being created by the present invention. Utilizing Himmelstein Option(s) allows the present invention to create a new type of market ("virtual market"); whereby barters may own and/or barter Himmelstein Options for Himmelstein Options, indefinitely, without having to possibly incur ordinary or capital gains taxes. Furthermore, as long as the individual who owns a Himmelstein Option or is in the possession of a Himmelstein Option does not go to settlement and "take title", the actual owner of the security defers a taxable event.

The system creates web barter dollars to further its ability to facilitate a virtual market. Web barter dollars are the system's currency with a unit (commodity dollar) which is preferably set to equal the U.S. dollar or some other standard such as foreign currency, gold etc. The

system, for example, uses web barter dollars to track an "I owe you" ("IOU") to individuals giving up a security but not simultaneously receiving a security back. Preferably, the system uses web barter dollars to supplement or balance a barter in lieu of other currencies such as the U.S. dollar. Using web barter dollars or cash simplifies the matching of barter orders where items of unequal value are traded.

When converting IOUs or web barter dollars to a different security, the system may charge a different fee based on the age of the IOUs. For instance, if the IOU is to be held longer, the system may charge a lower percentage or lower fee to convert to U.S. dollars. Further, the system may charge a different fee or a different percentage based on the relationship with a particular individual requesting the conversion. The system and barterers may barter web barter dollars for cash at different values. For example, the system may charge a fee to convert from web barter dollars to cash, but as an incentive provide extra web barter dollars for cash. Should there ever be a need to have the system redefine or modify its definition for IOUs or web barter dollars, the system reserves the right (in the Agreement(s)) and can do so. For example, the system may change IOU's or web barter dollars to system funds, which are portable and permit a barterer to transfer shares of system funds to specific institutions without having to redeem shares and possibly incur a taxable event. Accordingly, those skilled in the art should recognize that the system can be configured to perform any, and all stock market, banking and financial institution functions.

Referring to Figure 1, one embodiment of a barter system 100 is illustrated which utilizes a computer-based website that may effectuate the trading of barter items. Barter items are defined including, but not limited to, stock, cash (foreign or domestic currencies), web barter dollars, Himmelstein Options, CD's, bonds, notes, Option Put, Option Call, Commodities/Futures, Annuities, Muni Bond(s), Government Bonds, Funds, Strips (Zero Coupon Treasuries), Ginnie Mae(s), Fannie Mae(s), Freddie Mac(s), UIT (Unit Investment Trust), T-bills and any future created or defined security, commodity or commodity money. Bartering different categories of items is supported by the system 100. For example, stocks can be bartered for bonds. The system 100 provides for its own "web-barter dollars" which may be

accumulated or traded by barters using the system 100 and are particularly useful in facilitating barters where items of unequal value are traded.

The system 100 may be a web-based application or a non-web-based application. The system may operate over a private network or a public network, such as the Internet, to facilitate a connection with a barterer's computer.

The system 100 preferably includes a barter website 106 which is accessed via an investing company website 102, or directly via the Internet using a computer such as a personal computer 114 or a wireless hand-held computer with Internet connectivity 110. Optionally, the system 100 may be incorporated as part of an existing investing company's website.

In the case of access via an investing company website 102, the barterer uses a computer such as a personal computer 108, a portable computer 116 or a wireless hand-held computer with Internet capability 112 to select a "Barter" icon 103 that incorporates a link 104 to the barter website 106. Once the icon is selected, the trader's investing company account information is transferred via a link 104 to the barter website 106. In this manner, the barter website 106 is produced with all of the relevant particulars of each item owned by the individual trader. For example, in the case of bonds, the website 106 preferably includes the entity that issued bonds, amount of bonds, market value, interest date and due date data. In the case of stocks, the barter website 106 preferably includes data indicating company, number of shares, market value and whether dividends are reinvested. Using the link 104, the barter website 106 is transparent to a barterer accessing it via the investing company website 102.

The system 100 can be further interfaced with traditional brokers so traditional brokers and clients without the resources to go directly "online" can barter in the same manner.

While the barter system 100 supports bartering different categories of items such as stocks, Himmelstein Options for stocks, notes, Himmelstein Options for notes, bonds, and Himmelstein Options for bonds, an online investing company hosting the "Barter" icon 103 can limit barters to certain categories of items. For example, an investment company website that provides online stock trading may chose to limit the barter website 106 to only stock and/or Himmelstein Options for stock and/or Himmelstein Option barter. This allows someone (a barterer) to acquire a Himmelstein Option which is, in this case, the right to own stock at a future

date which allows the other barterer the ability to delay or defer the taxable event. This is accomplished by setting an appropriate filter so that only stock and/or Himmelstein Option is identified in the barter orders. Preferably, such a filter also allows use of web-barter dollars and/or cash which enables a wider range of barter orders to be matched and barter transactions to be completed.

Regardless of the items bartered, the barter website 106 comprises three main components: a barter ordering module 105, a posted barter order database module 117 and a barter matching engine 118. Optionally, the system 100 may include a separate database (not shown) of each individual's portfolio for all securities. In general, the barter ordering module 105 permits a trader, herein referred to as the barterer, to create a barter order that includes the item to be traded, the item desired and additional parameters related to the barter order.

The table set forth in **Figure 9A** reflects typical parameters associated with various classes of items or securities to be identified in a barter order. In each barter order, the appropriate parameters are identified for both the item to be traded and the item to be acquired so that the barter order comprises two sets of item parameters. The two sets of parameters may be quite different where the two items, which are the subject of the barter order, are of a different class or type.

Each portfolio item, regardless of type or classes, may optionally be transformed into a Himmelstein Option agreement by defining a future date or range of dates for settlement using the last column in the table **Figure 9A**. The Himmelstein Option is posted for immediate barter, but is subject to the specific settlement date or range identified.

A Himmelstein Option permits a security to go "under agreement" with a specific future closing date, (similar to a purchase of real estate). Presently, the IRS does not treat this as a taxable event at the time of the agreement. An individual who owns a Himmelstein Option may barter it again (with the same or different terms as the original agreement) without having settlement and obtaining ownership of the underlying security. Obviously, "different terms" are limited to a subset of terms of the original Himmelstein Option agreement that was issued.

The "standard" Himmelstein Option requires that the individual acquiring the Himmelstein Option must put up the full amount of the desired security at that time, (i.e. and

nothing at settlement). If the desired security is also a Himmelstein Option, providing the rights to acquire or transferring the rights meets this requirement. It should be noted that each Himmelstein option may have different future dates for settlement. The IRS may attempt to claim that this constitutes a derivative. However, if an individual is bartering away a security and barters for a security, on future dates utilizing Himmelstein Options, they are receiving a derivative and giving away a derivative. Consequently, in most cases, these derivatives in essence, "cancel out." The system 100 may further require that the barterers agree on the value for the Himmelstein Option should the IRS consider it a derivative. Preferably, the system sets the "barter value" as the default agreed upon value.

The person who issues a Himmelstein Option or barters an acquired Himmelstein Option chooses the future date or range of dates for settlement and value which must be accepted by the acquirer. If there was a future range of dates given for settlement, it is the choice of the person acquiring the Himmelstein Option to go to settlement within the specified range. The "standard" Himmelstein Option automatically goes to settlement on the final day should the person acquiring the Himmelstein Option not choose a date. The system 100 may charge an additional fee for the actual settlement.

When an individual creates a barter order for any security, the system 100 produces an Agreement of Barter, Exchange or Sale (i.e. terms and conditions). Barterers, in essence, fill in the "blanks" of the Agreement of Barter, Exchange or Sale. The system 100 may also require electronic signatures to accompany the Agreement or may create a parallel Agreement for each barterer for simplicity and anonymity purposes. The Agreement is also with the system 100, providing various conditions or rights that the system 100, intermediary or designated agent(s) has with the barterer.

At settlement of transactions comprising Himmelstein Options, title to the security or financial interest, which is the subject of the Himmelstein Option, is transferred. For stock, for example, settlement may require the actual transference of Stock Certificates. Preferably the traded stocks are not in paper certificate form so that a book entry of the stock transfer may be made to transfer title.

Once bartered, a Himmelstein Option cannot be canceled by its creator. Himmelstein Options may continually be bartered without being required to have settlement. Examples of a Himmelstein Option with appropriate parameters for each of nine different classes/types of items are set forth in the table of Figure 9B. Similar to Figure 9A, in Figure 9B each row shows one of the items of a barter order, i.e. an item to be bartered or an item to be acquired. A Himmelstein Option may be identified as a "to be bartered item" and actual stock may be identified as a "to be acquired item" in a given complete barter order. A Himmelstein Option may be acquired via the barter system as soon as it is posted, but the actual ownership of the financial interest, which is the subject of the option, is not transferred to the acquiring party until the acquiring party exercises the Himmelstein Option during the settlement period.

When the barterer creates a barter order, the system 100 creates an order number referencing the barter order. The system 100 may randomly create or code barter order numbers so only the system 100 is aware of the age of a barter order and the identity of the barterer. The posted barter order database module 116 accumulates posted barter orders and includes the software to add, delete and maintain the data in the database. The barter matching engine 118 selectively matches a barterer's barter order with posted barter orders in the database 116. Posted barter orders "matching" a barterer's order are displayed such that the barterer can select a candidate or candidates from the displayed listing of matching posted orders. The matching process functionally operates as a filter to display posted orders matching a selected criteria. Preferably, the filter is set to match the barterer's selected item to be acquired with posted orders having the same item to be bartered. The quantity of the selected item may also be used for filtering to require a direct quantity match or a match within a quantity range. The barterer's selected item to be bartered is also a preferred criteria for the matching filter, so that postings are displayed of barter orders which seek to acquire the item selected to be bartered by the barterer. A preferred filter includes both the barterer's selected item to be bartered and selected item to be acquired. Optionally, the filter may allow both specific items of a class as well as Himmelstein Options for the specific items. Thus, where a barterer's desired item is IBM stock, posted barter orders seeking to barter away IBM stock or Himmelstein Options for IBM stock are displayed as matches.

The barter matching engine 118 is configurable to either match one "best" posted order or multiple posted orders with a barterer's order. The barter engine 118 can also be configured to use the barter website (or an entity chosen by the website) as an intermediary as explained in greater detail below.

Figure 2 illustrates a typical stock and/or Himmelstein Option for stock and/or Himmelstein Option barter transaction involving sample posted barter orders 204-224 stored in a database 216 of module 116 and a sample barterer's barter order 226. In this example, the barter order includes the stock to be bartered indicated by stock symbol 228, the quantity 230 of the stock to be bartered, the value 232 at which the barterer is willing to barter, the desired stock 234 indicated by stock symbol, the value 236 the barterer is willing to barter for the desired stock, and an "*" indicating the ownership of the Himmelstein Option for the stock instead of ownership of the stock itself. Preferably, the settlement date(s) are displayed for all Himmelstein Options. The stock values of a barter order need not be a fixed value. For example, values identified for several of the posted barter orders 204, 208, 212, 218-224 are based on the current market price of at least one of the respective stocks. Barter order 226 indicates that the barterer has 45 shares 230 of Dupont stock (stock symbol DD) 228 which the barterer is willing to trade at a value of \$20 per share 232 for Aetna stock (stock symbol AET) 234 at a value of \$90 per share 236. If the matching criteria is set to match only the barterer's acquire item selection (including Himmelstein Options for the item), orders 204, 206, 208 are displayed. If the matching criteria is set to match only the barterer's barter item selection (including Himmelstein Options for the item), orders 206, 208, 216 are displayed. If the matching criteria is set to match either the barterer's barter or acquire item selection (including Himmelstein Options for the item), orders 204, 206, 208, 216 are displayed. If the matching criteria is set to match both the barterer's barter and acquire item selections (including Himmelstein Options for the item), orders 206 and 208 are displayed. An order combining orders 204 and 216 may also be displayed in that situation.

Other criteria such as market value and the other parameters identified in Figures 9A and 9B for each barter item may be displayed and used for matching. For example, where barter value is required to be matched, if the market value of Dupont stock is \$20 per share, the barter

engine 118 matches the order 226 with only one of the posted barter orders from database 216 namely, with posted barter order 208 from the database 216 since this posted order 208 barter Aetna stock for Dupont stock at the same value prices.

Where an additional matching parameter is set that all of an item of a barter order must be bartered, the Himmelstein Option for all 100 Aetna shares of posted barter order 208 must be bartered. In the example, the barter matching engine 118 would then fail to match barter order 226 with any posted order unless the barter website 106 acts as an intermediary as described below. Conversely, in an embodiment where the barter orders include a minimum share barter parameter, the barter engine 118 matches barterer order 226 if the minimum share parameter of the posted barter order 208 is less than 11 shares.

Figure 3 illustrates a multi-order barter selection 300 having first 302, second 308, third 314 and fourth 320 barter orders according to the present invention. Multi-order barter selection may be used either when no single barter order matches are found irrespective of whether single barter orders matches are found in order to find all potential available barters among the posted barter orders. In this example, the barter engine 118 cannot fulfill the first barter order 302 with a single one of the other barter orders 308, 314 or 320. The first barter order 302 barter Microsoft stock (stock symbol MSFT) 304 for RedHat stock (stock symbol RHAT) 306. None of the other posted database orders barter RHAT for MSFT, but barter order 302 can be fulfilled if intermediate barters are matched. The barter matching engine 118 matches intermediate barters using several methods. In one embodiment, barter matching engine 118 searches for a posted barter order having a desired stock/Himmelstein Option that matches the barterer's stock/Himmelstein Option to be traded. Since posted barter order 320 lists MSFT as the desired stock 324 and the first barter order 302 stock to be bartered is MSFT 304, the barter matching engine 118 search for the first half of the first barter 302 has been satisfied. However, the barter matching engine must find a match for the desired stock 306 for the first barter order 302 and must also find a match for the first half 322 of the third barter order, 320. Accordingly, the barter matching engine must find a transaction that satisfies the desired stock Oracle (stock symbol ORCL) 322 of the third barter order 320.

The barter matching engine 118 searches for an order that trades ORCL for RHAT in order to make a two posted order barter transaction. However, in the example, there is no posted order that trades these two stocks, so the barter matching engine 118 locates barter order 308 that trades Puma Technologies (stock symbol PUMA) 310 for ORCL 312. The barter matching engine 118 then searches for another posted barter order that trades RHAT for PUMA to find a transaction candidate. Barter order 314 meets this criteria in that RHAT 316 is traded for PUMA 318. Accordingly, barterer order 302 can be satisfied through posted barter orders 320, 308 and 314. In a preferred embodiment so as to make the multi-order transactions transparent to the barterer, barter matching engine 118 displays multi-order barter as a single "phantom" posted barter order. The matching engine 118 creates a transaction and displays this phantom barter order in the list of matching barter candidates. The barterer simply selects the phantom barter order to finalize the multi-order barter transaction. In these examples, it is assumed that the values and other parameters set by the barterers permit all barter orders to occur.

In another method for locating multi-order barters, barter matching engine 118 begins by searching for the barterer's desired stock 306 first. Barter engine locates barter order 314 that trades RHAT 316 for PUMA 318. Continuing in this manner, the engine locates the same posted barter orders as above, but in the reverse order. In general, the engine 118 attempts to link multiple barter orders. One of ordinary skill in the art of software programming appreciates that a recursive algorithm is well suited for generation of such a linked list.

The operation of barter ordering module 105 allows the barterer to enter the barter order. In one embodiment of the present invention, the barterer selects minimum barter order parameters such as the specific stock, quantity and value price of the stock to be bartered in addition to the desired stock and value price for the stock desired. Once these minimum parameters are selected, other parameters are set to default settings determined by barter ordering module 105. In another embodiment, order parameters have interdependencies. For example, a barterer selects a quantity of shares of a stock to be traded as 100 shares and sets the per share value price to \$15. The total value of the stock, \$1,500, is computed by the barter ordering module as the product of the quantity of shares, 100, and the per share value price, \$15. In the case where the barterer subsequently changes the total value of the stock from \$1,500 to \$2,000,

the per share value price of the stock changes automatically to \$20 since the value per share must be \$20 to achieve the \$2,000 total value with the 100 shares.

Barter orders may be created for stock and Himmelstein Option for stock barter as illustrated in flowcharts **Figures 4A-4E** and the screen displays of **Figures 5A-5F** where the barterer is prompted through each step of the barter order creation process. For bartering other securities or financial interests, including Himmelstein Options, the bartering steps and screen displays are modified to preferably accommodate all of the parameters for the classes of items identified in **Figures 9A-9B**.

The system 100 in its most generalized configuration permits barter of different securities, financial interests (including Himmelstein Options), or classes of items, i.e. Himmelstein Option for stocks for bonds, foreign currency for Himmelstein Option for T-bills, commodities for stocks, options for T-bills etc. The most generalized configuration of the system 100 permits a barterer to select any item in the barterer's portfolio of securities or financial interest as the subject of a Himmelstein Option which is immediately available for bartering where the title to the security or financial interest is not actually transferred until the Himmelstein Option is exercised in the range of settlement dates specified by the barterer creating the Himmelstein Option. Where a barterer's portfolio includes such Himmelstein Options, that barterer may create a Himmelstein Option of the Himmelstein Option in which case the range of settlement dates would be within the settlement date range of the original Himmelstein Option.

In the example of **Figures 4** and **5**, barter website 106 is accessed via an online stock trading company that limits bartering to stocks, Himmelstein Options for stock, cash, web barter dollars and combinations thereof. The flowchart of **Figure 4A** begins after the trader selects "Barter" icon 103. Accordingly, barter ordering module 105 has received from the online stock trading website a barterer's list of currently owned stocks, Himmelstein Options for stock, web barter dollars and cash in the barterer's portfolio as well as the quantity and other specifics of these securities via link 104. At step 402 **Figure 4A**, the website displays all of the barterer's stock, Himmelstein Options for stock, web barter dollars and cash available for barter. In step 404, The barterer selects from the displayed items in step 402. In the embodiment of **Figure**

5A, a symbol 502 representing a selection of the barterer's portfolio of stocks, Himmelstein Options for stock, web barter dollars and cash is displayed. The barterer selects, the downward triangle 501, to display all available stocks, Himmelstein Options for stock, web barter dollars and cash as shown in 503, an * indicating the ownership of a Himmelstein Option for the stock and date or range of dates for settlement instead of ownership of the stock itself. Preferably, blanks are provided to indicate an indefinite opening or closing for the Himmelstein Option settlement period. For example, the DuPont Option, DD* is depicted having an indefinite closing date.

The system preferably further indicates if the barterer's security is currently included in a posted barter order requiring the barterer to cancel said posted barter order prior to selecting the security for a new barter order. Optionally, an alphabetical list of companies and/or stock symbols is displayed for alphabetical searching and/or the portfolio quantity 504 of the stock is also displayed. The barterer may enter the selected item 502 by typing it in. Preferably when the barterer begins typing the name or symbol of the company, the barter ordering module locates the first listed item that matches the entered characters. Alternatively, the portfolio is displayed for selection via an array of pull down menus 507, each displaying one class of the items of the barterer's portfolio.

Once the barterer locates and selects the item to be traded, the total quantity of the selected item in the barterer's portfolio (as may be provided by the online stock trading website) is automatically displayed in step 406 of Figure 4A as the quantity to be bartered. At step 408, the barterer can modify the quantity to be bartered 410. As shown in Figure 5A, the quantity 504 can be modified via selection of the directional arrows 505 or the barterer can enter a new quantity value. In either case, in this embodiment the barter order module 105 does not allow a quantity value that exceeds the quantity owned by the barterer. Alternatively, the system 100 may be configured to permit the barterer to select a range of quantities to be bartered. For example, the barterer may specify a range such as 50-100 shares for barter.

Preferably, the barter ordering module 105 has access to trading prices at step 412 of Figure 4A, so that the trading price of the selected stock is displayed along with the time and date of the trading price as illustrated in display section 506 of Figure 5A. A fixed per share

value of the stock or Himmelstein Option 508 of Figure 5B is initially set to the trading price. If barterers are trading away cash or web barter dollars, the system 100 in that instance may rearrange the screens and prompt the security being bartered for prior to prompting the cash or web barter dollars being traded away. As one skilled in the art will realize, the fields which are not applicable to cash or web barter dollars are modified to properly reflect what is being bartered. At step 414 of Figure 4A, the barterer can elect to trade at the displayed trading price or select a new barter value 416. As Figure 5B illustrates, the barterer can change the default fixed per share value 508 or select the value of the stock to be bartered based on the fluctuating stock trading price by selecting block 510.

By selecting the fluctuating value price, the value fluctuates until a barter transaction is finalized by a subsequent barterer who selects the barter order. For example, if IBM stock was trading at \$115 per share and the barterer selects "barter at current stock trading price", the barter price would be \$115 per share if the transaction occurred instantaneously. However, if the barter transaction occurred two weeks later and the stock-trading price dropped to \$110, then \$110 would be the barter value price. Likewise, if the stock-trading price went up, then the barter price would be that higher price.

Optionally, the barter value can be based upon the current stock trading price plus or minus a certain value or percentage in step 416 in Figure 4A and at step 511 in Figure 5B or the barter value can range around a fluctuating trading price specified as either a value amount or a percentage of the fluctuating trading price. To do this the barterer selects a range around the fluctuating stock value as illustrated in Figure 5B at 512, 518. The range can be a value amount 514, 517 or a percentage of the fluctuating trading price 516, 519. By selecting boxes 512 or 518, the barterer selects whether the range is added to or subtracted from the fluctuating value. For example, if the range was set to plus 1 percent at step 416 (by selecting box 512 and entering 1% in box 516) and the market price for IBM stock to be bartered; at the time of the barter transaction was \$115 per share, a posted barter order with a value price between \$115 and \$116.15 would match the barterer's order. A barterer may issue a Himmelstein Option to barter away IBM stock as low as minus 9 percent of the \$115 IBM market price by checking box 518.

and entering 9% at box 519 so that a posted barter order with a value price between \$104.65 and \$115 would match the barterer's order.

Once the value of the item to be bartered is selected in step 416 of **Figure 4A**, the barter ordering module displays at step 418 of **Figure 4B** the total barter amount and the percentage or dollar amount of the value price in relation to the available market price per share in **Figure 5B**, at 520. Should a range of value price be selected, the display 520 is modified to reflect such. In the example of **Figure 5B**, the barterer can change the barter value 520 by clicking on a "change" icon 522 and going through the appropriate steps or accept the value 520 by clicking on a "continue" icon 523. This is also shown at step 420 of **Figure 4B**.

At step 422 of **Figure 4B**, barter order fee amounts are displayed. Fee amounts, as illustrated in sample screen display lines 524 and 526 of **Figure 5C**, are determined based on whether the barter order is to be posted to the barter order database 524 or the barter should occur with the barter website directly 526.

At step 424 of **Figure 4B**, the barterer selects the time in which the barter order is valid. As illustrated in the embodiment of **Figure 5C**, timing options 528 are displayed once the barter selects the down arrow. The five options are:

- 1) day only;
- 2) good until canceled;
- 3) fill or kill;
- 4) immediate or cancel; or
- 5) only view the current posts.

The "day only" option means that the barter order can be posted to the posted barter database only until the end of the day. Thereafter, the barter order is expunged from the posted barter order database. The "good until canceled" option means that the barter order remains posted to the posted barter order database until it is canceled by the barterer. If the "fill or kill" timing option is selected, the entire quantity must be filled or the barter order is canceled. With "fill or kill" timing, the barter order is not be added to the posted barter order database, but the database is searched for a match. Similarly, a barter order is not added to the posted barter order database if the "immediate or cancel" timing is selected. In this case, a posted barter order for

only part of the barterer's quantity matches the barterer's order. The last timing option, "only view the current posts", never adds the barter order to the posted barter order database. Instead, the barter matching engine 118 displays the current matches found in the posted barter order database.

At step 426 of **Figure 4B**, the barterer may select special conditional parameters. The available special conditions are "minimum quantity," "do not reduce," "all or none," and "deferred settlement." The display portion 530 of **Figure 5C** illustrates one means of selecting special conditions. In this embodiment, the barterer may select one of the conditions by selecting a corresponding box. If the minimum quantity condition is selected, the barterer then either adjusts the display quantity via the arrows or enters a minimum quantity value. The default minimum quantity may be set to equal the barter quantity 504. Selecting "do not reduce" means the per share value will not be reduced even if the transaction date is the stock's dividend date. If the barterer selects the "all or none" option, all barter matches must barter the entire quantity of the stock to be traded away.

Selecting the "deferred settlement" condition creates a Himmelstein Option of the item being bartered. The barterer is then required to identify open and close settlement dates, which may be the same. If the barterer is already bartering a Himmelstein Option, the barter ordering module 105 automatically selects "deferred settlement" and displays the date used by the original creator/issuer. The barterer may modify the dates as long as the modified dates are within the range of dates used by creator/issuer. Optionally, at step 531, **Figure 5C** the barterer may enter a subsequent amount of the security or a different security to be provided at settlement. As hereinbefore described, the system will prompt barterer to include minimum criteria to clearly identify the security and the value.

At step 428 of **Figure 4B**, if the desired security is stock, the barterer selects between three choices for the desired stock with respect to a dividend reinvestment option. Accordingly, the barterer chooses between: 1) the stock must have a dividend reinvestment program; 2) the stock must not have a dividend reinvestment program; or 3) accept new stock with or without a dividend reinvestment program. In the embodiment illustrated in **Figure 5D**, the barterer selects the desired option by selecting the corresponding box in section 532.

At step 429 of **Figure 4B**, the barterer chooses the type of barter they wish to transact, (i.e. a direct barter only or permit the website to act as the barterer or use an intermediary if a direct barter is not available). The barterer can request a direct barter with an order from the posted barter database at a first fee rate, or in the alternative for a second fee rate, the barterer can request the website to be the barterer. The first and second fee rates may be the same or change independent of each other. At times to promote automated website bartering, depending on the securities to be bartered, the second fee rate may be set at a relatively low rate, or it may be set to a premium rate for the automated service. According to the embodiment illustrated in **Figure 5D**, the barterer selects the type of transaction in section 534.

Following the selection of barter type, step 429, posted barter orders may optionally be displayed 430 based on matches of posted order "to be acquired" items with the barterer's "to be bartered item." In the case of a direct barter, a trade can be displayed immediately if a match is found in the database, or the barterer can complete and post the order to the database and await a match from a subsequent barterer. In the case of a barter with the website, the transaction is displayed immediately provided the website can buy or obtain the stock, Himmelstein Option, web barter dollars or cash desired by the barterer. Here, the website uses a predetermined formula including taking into account the relationship with the barterer to calculate the fee for this type of transaction.

The barterer selects the desired stock, Himmelstein Option, web barter dollars or cash price to acquire for the barter order at step 431 of **Figure 4B**. If the barterer's desired security is a stock, Himmelstein Option, web barter dollars or cash, the barterer checks the appropriate box in display 537 as illustrated in **Figure 5D**. Optionally, if the barterer's desired security is stock, the system 100 displays all stock and Himmelstein Options for the desired stock in the database, allowing the barterer to accept a Himmelstein Option in lieu of actual stock. In a manner similar to that of selecting a stock to be traded from the barterer's portfolio, stock symbols 535 are displayed upon selection of a down arrow. Optionally, the barterer can select from a list of industries 536 wherein the stock symbols 535 are filtered to list only those related to the selected industry. Alternatively, a merged alphabetical list of companies and/or stocks is shown for

alphabetical searching. Additionally, the system 100 can be configured to show various companies (in a predefined sort) including the symbol and predefined financial information.

If the barterer chooses a stock or Himmelstein Option, by selecting it, the system 100 displays the symbol 535 pertaining to the chosen company. Next, in step 432 of Figure 4C the barter ordering module informs the barterer of the available stock trading price of the desired stock/Himmelstein Option, along with the current date and time. One method of displaying the price is illustrated in Figure 5D at section 538.

The barter value of the desired item defaults to the available stock trading price at section 540 of the display of Figure 5E for stock, or Himmelstein Option. Further, if the system 100 had a barterer trading a stock or Himmelstein Option for cash or web barter dollars, the system 100 may prompt in 540, the stock trading price of the stock or Himmelstein Option being traded away. The barterer can accept the displayed value at step 434 or select a new value at step 436 of Figure 4C. In the display of Figure 5E, the desired stock value for stock or Himmelstein Option can be selected similar to that of selecting the stock value to be traded. The barterer can select a fixed value using box 540 or a value plus or minus the stock trading price (similar to step 511, as shown in Figure 5B) or a fluctuating stock value range in section 541 in a manner as described in connection with 510-519 of Figure 5B. The stock value can range around a fluctuating trading price specified as either a value amount or a percentage of the fluctuating trading price. Thereafter, as indicated in the flowchart of Figure 4C at step 438, the total desired barter amount and percentage or dollar amount to the stock trading price is displayed as illustrated in sample display 542 of Figure 5F. At step 440 of Figure 4C, the barterer can change the barter value of the desired item which steps can be implemented by clicking the "change" icon of display section 542 of Figure 5F.

At step 442 of Figure 4C, the present invention assists the barterer in determining whether the barter order is financially advantageous to the barterer. Several ratio formulas, termed Himmelstein Value Ratios, are provided to assist the barterer. In the embodiment of Figure 5F at section 544, the barter ordering module selects the specific formula and the Himmelstein Value Ratio is displayed. The barterer may then change the barter order per step 444 by selecting a change icon in section 544 of the display Figure 5F.

In an alternative embodiment, the barterer selects the desired formula after receiving help text describing the formulas. Regardless of the method used to select a particular formula, there are three preferred formulas:

Value Ratio 1) $(x/y)/(a/b)$

Value Ratio 2) $(a/b)/(x/y)$

Value Ratio 3) $(b/a)-(y/x)$

where: a = value price for security/Himmelstein Option desired to trade away

b = current security trading price for security/Himmelstein Option desired to trade away

x = value price for security/Himmelstein Option desired to obtain

y = current security trading price for security/Himmelstein Option desired to obtain

For example, using Himmelstein Value Ratio 2, a barterer owning Coke stock or Coke Himmelstein Option is willing to barter it away at a value of \$65 per share, and Coke is currently trading at \$67 on the stock market. If the barterer desires to barter for IBM stock, or IBM Himmelstein Option at value of \$110 per share and the stock is currently trading at \$115 per share on the stock market, the value ratio formula is: $((65/67)/(110/115)) = 1.014$, which means that if the barterer trading Coke stock/Coke Himmelstein Option for IBM stock/IBM Himmelstein Option chose to complete the transaction, they will gain 1.4 percent. In essence, in this formula anything less than 1 is a stock/Himmelstein Option barter transaction that loses value and anything greater than 1 is a transaction that gains value. This formula is important to understand the relationship between the value of the stock/Himmelstein Option that is being traded away and the stock/Himmelstein Option that is being obtained. In lieu of displaying the value ratio, the system 100 may display the actual percentage of increase or decrease after interpreting the value ratio. Variations of the above formulas may also be used. Any Himmelstein Value Ratio formula may be modified by adding or subtracting a predetermined value or variable. For example, Formula $(a/b)/(x/y)$ may be changed to have the value "-1" subtracted to it making the new Formula $(a/b)/(x/y)-1$. If Himmelstein value formula $(a/b)/(x/y)-$

1 is greater than 0.00 then to what extent greater is the percentage of profit, which in the above COKE/IBM example is 1.4%. Any Himmelstein Value Ratio formula may be modified by multiplying or dividing a predetermined value or variable. For example, formula $(a/b)/(x/y)$ may be changed to have the variable "y/x" multiplied to it making the new formula $(a/b)*(y/x)$ or $(y/x)*(a/b)$. If Himmelstein value formula $(a/b*y/x)$ is greater than 1.00 then to what extent greater is the percentage of profit, which in the above COKE/IBM example is 1.4%. Any Himmelstein Value Ratio formula may be modified by having both a predetermined value or variable added or subtracted while at the same time multiplying or dividing by another predetermined value or variable. For example, formula $(b/a)-(y/x)$ may be changed to have the value of "1" added to it and have the variable "-1" multiplied to it making the new Formula $((-b/a)+(y/x))-1$ or $((y/x)-(b/a))-1$. If Himmelstein value formula $((y/x)-(b/a))-1$ is greater than -1.00 then to what extent greater is the percentage of profit, which in the above COKE/IBM example is 1.4%.

For securities such as CD's, bonds, annuities and government bonds that provide an interest rate/current yield until a due/maturity date, the system may calculate the actual income from that present day forward to be earned, factoring in the type of interest and adding same to all applicable variables (i.e. b or y) in the above stated formulas. For the securities stated above, the barter order module may require the settlement date to be the same date as the due/maturity date. In other words, the variables in the above formulas would be defined as:

a = value price for security/Himmelstein Option desired to trade away.

b = current security trading price for security/Himmelstein Option desired to trade away, plus future interest income from that present day forward to be earned, but not paid, before the earliest settlement date of the securities being bartered.

x = value price for security/Himmelstein Option desired to obtain.

y = current security trading price for security/Himmelstein Option desired to obtain, plus future interest income from that present day forward to be earned, but not paid, before the earliest settlement date of the securities being bartered.

For barter items or securities such as CD's that do not have a current trading market, the system 100 can also calculate the accrued, not paid, interest from issuance up to the present day.

In other words, the variables b and y in the above formulas in such instances are modified as follows:

b = system calculated security trading price for security/Himmelstein Option desired to trade away includes the following:

- original purchase price or face value of barter item or security plus,
- accrued unpaid interest income from issuance up to the present day plus,
- future interest income from that present day forward to be earned, but not paid, before the earliest settlement date of the securities being bartered.

y = system calculated security trading price for security/Himmelstein Option desired to obtain includes the following:

- original purchase price or face value of barter item or security plus,
- accrued unpaid interest income, from issuance up to the present day plus,
- future interest income from that present day forward to be earned, but not paid, before the earliest settlement date of the securities being bartered.

Optionally, for securities such as CD's that do not have a current trading value, the system 100 may have the applicable variables (i.e. b or y) include the original purchase price or face value plus accrued interest income, excluding future interest income so that the system provides a "current day" value. The barterer may select the desired formula, including the definitions of b and/or y for each security in a barter transaction after receiving help text describing how each variable may optionally be defined in the formulas.

If the securities being bartered have different due/maturity dates, the system 100 may use the present day to the earliest settlement date as the period of time for calculating the income to be earned, calculating each securities' actual interest rate/current yield, factoring the type of interest, and adding same to the respective variables (i.e. b or y). To ascertain a more accurate value ratio, when one security has interest income, such as CD's, and another security does not, such as stock, the system may include or exclude interest income from the value ratio formulas depending on the formula chosen by barterer/system. The system 100 may disclose and/or incorporate the actual formula(s) used to ascertain the value ratio into a finalized transaction agreement.

Where no conventional market value is available, the system 100 may be configured to examine posted barter orders or develop methods or new formulas to determine a current trading price.

Referring to Figure 4D at step 446, the barterer can review the barter order prior to submission of the order to the barter matching engine. As illustrated in the embodiment of Figure 5F the barter order module lists at section 546 the terms and conditions before the barterer submits the order by clicking an appropriate icon 548. Alternatively, the barterer may decide to terminate the barter order creation by clicking a "QUIT" icon 549.

Once the order is submitted by the barterer at step 448 of Figure 4D, the matching engine searches the website database for a barter order or in an embodiment where the engine matches multi-order barterers, multiple barter orders to satisfy the submitted order. If no match is found at step 450, the barter matching engine determines whether the order should be posted to the database 452 based on the timing selected at step 424 of Figure 4B. If the order should be posted, the barter order database module 116 posts the order to the database.

After the barterer clicks on the "continue/agree" icon 548, (and depending on the timing chosen), the system 100 in accordance with Figure 4D posts the barter as an available transaction 452, 456 and/or finds and displays "matching" posted barter orders 450, 454 via the screen display illustrated in Figure 6. The "matching" in the preferred embodiment includes matching the barterer's desired item and barter items with the barter and desired items of single or multiple combinations of posted barter orders where any matched Himmelstein options have overlapping settlement dates.

Where posted barter orders are displayed, preferably the barter orders are listed by the lowest share price of the stock or Himmelstein option that the barterer wishes to acquire such as in display section 610 of Figure 6. If any one of the available barter orders requires the price to fluctuate with the stock market, the display is preferably continually updated so that the prices reflect market value as close to real time as possible. The screen also displays the order number, symbol, share price, ratio to stock trading price, value ratio, number of shares, barter amount, barter price fluctuate with stock trading price, special conditions, timing, and dividend reinvestment criteria.

If the individual decides that they are willing to barter away some or all of their selected portfolio stock/Himmelstein option for one or more barter orders listed, they select to do so 458, of **Figure 4D** (or as long as they have more barter amount available) by simply clicking on each order, (i.e. choosing first preference then second preference, and so on). Each time an order is chosen, the system 100 permits/requires the individual to revise their original quantity, and value price in the stock/Himmelstein option for which they desire to trade away in the barter, thereby requiring the individual to accept the prices and the amount of stock/Himmelstein option received in return from the barter order that they had selected. When a posted order is chosen, the system 100 enters the corresponding information in a table on the screen to notify the individual of the transaction number, number of "shares trading away" with item price, number of "shares receiving" with item price and barter amount with totals at bottom of the table as reflected in screen table 620 of **Figure 6**. For cash and web barter dollars, the fields which are not applicable remain blank. Optimally, the system may display in 620, the after date and before date for Himmelstein Options being acquired or bartered.

Each time a transaction is chosen, the system 100 reduces the value for "amount of barter left" in a display box 622. If an individual has less than an available barter transaction, (with no special conditions nor timing limitations) when the individual selects the order number, the system 100 shows the number of shares for which the barter is permitted. Upon selecting each order, the system 100 shows the residual amount in a display box 624 and presents three choices 460: 1) hold stock/Himmelstein option in escrow; 2) donate the stock/Himmelstein option; and 3) purchase other stock/Himmelstein option. If any of these choices are chosen, the system 100 displays additional screens to complete the above tasks. Optionally, the system 100 may allow the barterer to convert the residual amount into web dollars, which are added to the barterer's portfolio after the transaction is completed.

Additionally, when a barter order is chosen, the system 100 "locks" the barter order, including the price, to the individual for a predetermined duration. A display of the time remaining to complete the transaction appears in a "time remaining" display box 626. Should the time expire, the system 100 provides two options: 1) finalize transaction; 2) or lose transaction in "X" seconds, with seconds decrementing on screen. The system 100 may, if desired, inform

the individual that someone else is looking at the same barter order and may inform other users that there are pending barter orders which may come available.

Upon the individual reviewing available barter orders and deciding what they want to do, (i.e. accept one or more orders or none), they proceed by choosing one of the following four icons 631-634: 1) clear; 2) change barter order; 3) finalize transaction; and 4) finalize transaction but display more barter options. Each option leads to the display of additional screens to complete the selected task as indicated in Figure 4E.

In addition to the main bartering screens, the system 100 may include pop-up screens to show "history" of past barter transactions and to show performance on how a security is performing, and the current value ratio formula provided from past transaction(s). If an individual bartered away Himmelstein Option(s) that have not gone to settlement, the system provides a screen selection showing the security or securities, the range of settlement dates allowed and preferably includes all of the criteria or information in the actual barter transaction.

The system 100 exhibits other special conditions such as if the value of a security falls, the system 100 may require barterers to barter some or all of a security back; an election to require that the value ratio must stay within a specified range for a specified time or trigger an action by the system 100 such as a penalty, or forcing the individuals switch some or all security back, etc.; and the entry of multiple securities or symbols, and corresponding value prices, and permit the system 100 to automatically take the best value ratio as long as value ratio is over a specific number (i.e. such as 1.00) set by the barterer and the system 100 automatically completes the transaction if posted barter orders exist meeting that criteria.

The system 100 may be programmed to automatically purchase security within a predetermined value range when a barter order is posted or market values change, complete a barter transaction for the barter order and sell the acquired security while charging an appropriate fee. The system 100 may act as a negotiator between barterers, sending each an e-mail or otherwise notifying them when the search engine discovers potential matches among barter orders. The system 100 may permit access by individual barterers to the identity of barterers who have posted "matching" barter orders to allow them to negotiate directly between themselves through e-mail or otherwise. The system 100 may require e-mail sent through it to

purge "identity" (i.e. ensure anonymity). The system 100 may create an e-mail subsystem allowing individuals interesting in bartering to enter limited pertinent information into the blanks of the agreement being presented to one another only identifying the individuals by the order number that was created by the system 100 when it originally posted the barter order. This is referred to as an "offer to purchase." The system 100 may lock the individual's security being offered for a specified time allowing the individual receiving the offer time to accept, modify, or reject the offer. In other words, the individual making the offer cannot back out unless the person receiving it fails to respond within the time frame, modifies it or rejects it.

The system 100 can also be configured for telephone access so that all functions that one may do online may be done over the telephone. Additionally, pre-approved individuals can be permitted to barter for securities (which the website holds in escrow) prior to bartering their own securities.

In the generalized version of the barter system, various types of barter may be implemented as schematically illustrated in Figures 7A through 7E.

Referring to Figure 7A, a two party exchange or direct barter is illustrated. For example, Individual "A" barters directly with Individual "B" effecting an exchange of securities, X and Y respectively. Example, Individual "A" issues or posts a Himmelstein Option to barter 100 shares of AOL worth \$1,000 (Stock "X") for 200 shares of IBM worth \$1,000 (Stock "Y") after 01/01/00 and before 02/01/05. Individual "B" accepts the Himmelstein Option effectuating an agreement to immediately barter 200 shares of IBM for the rights to acquire 100 shares of AOL in the future. A receives the 200 shares of IBM from B and irrevocably commits A's 100 shares of AOL to be transferred to B or B's designee at any time settlement is demanded between 01/01/00 and 02/01/05.

In the event the barter transaction is not an exact match in value, the system 100 may balance the barter transaction by allowing one barterer or the other to pay cash, provide web barter dollars, offer a different security, such as a Himmelstein Option on a different security, or allow the barterer to acquire more of the particular security that they are bartering.

Referring to Figure 7B, a two party exchange with an intermediary is illustrated. For example, Individual "A" barters with Individual "B" to trade away security X and acquire

security Y through an intermediary. If a match is located but the values are not equal, the intermediary may retain the excess security and supplement the barterer bartering away the greater value security with cash, provide web barter dollars, a different security, such as a Himmelstein Option on a different security, or acquire more of the desired security (by first acquiring such).

The intermediary either obtains additional cash, a security, such as a Himmelstein Option, or more of the desired security, such as a Himmelstein Option from the other barterer and/or from a third party (upon which the intermediary reciprocates a security, such as a Himmelstein Option, cash, or web barter dollars). For example, using the same values above, Individual "A" issues or posts a Himmelstein Option to barter 100 shares of AOL for 200 shares of IBM. Individual "B" has 100 shares of IBM that he would like to barter for the rights to acquire 50 shares of AOL in the future. The intermediary keeps the Himmelstein Option for 50 shares of AOL and acquires the additional 100 shares of IBM and completes the exchange with individual A.

Figure 7C illustrates a three party transaction with an intermediary. Individual "C" barters away security Y to receive security X. The intermediary, which may be the barter website, identifies Individuals "A" and "B" to complete the transaction. Individual A sells or barters security X for cash and Individual B buys or barters security Y for cash. The cash amounts may or may not be equal, but Individuals A, B and C may incur a service charge from the intermediary/website for the service provided. In lieu of cash, web dollar credits are preferred where the website acts as intermediary. In another embodiment, the system 100 may allow the barterers to barter away their securities or financial interest at a different time than when they receive a security or financial interest. This is a "Deferred Exchange."

Figure 7D illustrates a three party transaction without an intermediary. In this example, barterer "A" receives cash for security or financial interest X. Barterer "B" receives security or financial interest X in exchange for security or financial interest Y. Barterer "C" receives security or financial interest Y for the cash which is received by barterer A.

Figure 7E illustrates a two party exchange with an intermediary. Barterer "A" wants to exercise a Himmelstein Option (i.e. have settlement and take title) to own the security in the

Himmelstein Option. In this illustration, the system 100 may require in the Agreement that to exercise the Himmelstein Option, the barterer must do so through the system 100. Barterer A trades the Himmelstein Option on financial interest X for the actual interest X to the intermediary. The intermediary acquires the interest X from source B in exchange for consideration Z. The intermediary then maintains Himmelstein Option for X in its own portfolio for future bartering. Z may be web dollars or some other security or interest acquired by the website in a similar manner. Alternatively, if the value of Z is more than the Himmelstein Option for X, the system 100 allows Barter "A" to exercise the Himmelstein Option (i.e. have the settlement on security X).

Where the system 100 or a designated entity acts as an intermediary, a barterer can create a barter order that does not require a security at the same time it barters away its own security. For example, an individual may allow their security to be bartered for an interest of equal value, which the barterer can identify at a later time. The understanding being that the barterer can defer the completion of the transaction by the website or a designated entity acting as intermediary. If another barterer accepted the barter order terms, the funds for the transaction are immediately placed in an escrow account. For example, if the current tax law permitted, the system 100 would allow "X" number of days to choose a particular security and "X" number of additional days to actually acquire the new security. Therefore, the website or a designated entity may hold the securities in escrow as a third party. The website or a designated entity may, upon being directed by the barterer who has funds in escrow, acquire a specific security to complete the barter. In this embodiment, the system 100 may continually update the barterer with respect to the security such as stocks (re: stocks that the individual informed the system that they were interested in) with respect to the current "closest" matches for a specific stock or range of stocks that exist in the database system, based on the value ratio formula(s) that were previously defined herein. This can be done by either e-mail, phone, or when the barterer accesses the website. While online, the system 100 may continually update the closest matches, thereby permitting an individual to either ignore, choose one, or choose multiple ones. If the individual chooses a match or several matches, with excess remaining funds, these excess funds are held in escrow.

The system 100 may be configured to only barter Himmelstein Options or the future rights. Reiterating, a Himmelstein Option is an agreement given by the individual that owns the barter item or security, an irrevocable right to another party that after a specific date and before a specified date, this party has the right to "go to settlement" and acquire the barter item or security. Further, the Himmelstein Option allows the party in possession or any party currently in possession to barter said Himmelstein Option, i.e. transfer said rights for settlement. Barter order parameters then include an "after date" upon which a Himmelstein Option may be exercised and an "expiration date" that the Himmelstein Option expires. The expiration date may be an indefinite date. For example, barterers may do this to diversify their portfolios where they do not have the right to sell a security immediately, (such as via a preexisting agreement with an employer company). If the security is unregistered, the system can, after the holding period, directly process the stock with a designated transfer agent in order for it to be allowed to be transferred, i.e. go to settlement. In this instance, only Himmelstein Options are able to be immediately bartered since the barterer cannot transfer the security until after a specific date.

The Himmelstein Option value and security value may be different, and usually would be different if the Himmelstein Option expiration date is a specified date and not open or "indefinite". Both dates and values are preferably displayed for matching barter orders in a manner similar to the display of **Figure 6**.

Acting as an intermediary, the system 100 can hold a barter item or security in a trust account if, or until, someone exercises a Himmelstein Option to acquire it. A barterer posting a Himmelstein Option barter order chooses the after and expiration date which date(s) must be within the terms of their Himmelstein Option if they are not the actual owner of the security. The system 100 may prompt the expiration date as "indefinite", with the barterer who is creating the Himmelstein Option away having the ability to modify the Himmelstein Option barter order with a specific date. The value of the "Himmelstein Option" is worth less if there is an expiration date, at which time the Himmelstein Option no longer exists. If the barter item or security subject to the Himmelstein Option is held in trust by the system 100, the system returns the item or security upon expiration date to the barterer who had offered the Himmelstein Option or the party who settled the Himmelstein Option and obtained "title." The purpose of the system

100 holding the security "in escrow", or in trust, is to ensure that a barterer acquiring a Himmelstein Option has a complete assurance that their right of ownership is "guaranteed" should they exercise it at a future date. The system 100 has the ability, (if it were a security such as stock or a mutual fund), to include or exclude the dividends, long term gains and losses and short term gains and losses. If the dividends, long term gains and losses, and short term gains and losses were included, at the end of each tax year, the 1099-DIV and gains and losses issued may be transferred to the system 100 as the "nominee" which may in turn, make the "nominee" the individual who had obtained the Himmelstein Option or the rights of ownership to the security.

Himmelstein Options having an "after date" and an "expiration date" when settlement can occur has a number of benefits for individual barterers. A barterer bartering away securities can ensure that a sale occurs after the barterer has owned the security more than one year so that any income is taxed at capital gains rate instead of ordinary income rate. If a barter works for a company that requires them not to sell the security for a specific time period, but the barterer wants to diversify their portfolio, the system 100 allows them to do so.

The system 100 has other advantages. For example, incorporating the security stock into a Himmelstein Option that is bartered removes uncertainty (i.e. future risk). This is beneficial in many instances. For example, successful, educated investors desiring to decrease their stock portfolio can recognize this benefit and utilize the Himmelstein Option to reduce their stock portfolio in a controlled manner.

Since the system 100 allows securities, such as CD's to be incorporated into a Himmelstein Option, if one wanted to become liquid prior to maturity, one can barter away a Himmelstein Option on the CD in lieu of incurring a penalty for early redemption. The net value of the Himmelstein Option issued is logically set by the barterer to be less than the penalty.

The system 100 is preferably configured to internally track all individual rights when acting as an intermediary or escrow. If a barterer wants to "cash out", the system may permit them to barter their securities including a Himmelstein Option away for cash, or alternatively require them to exercise their Himmelstein Option and then sell their securities that they acquired.

For tax purposes, the system 100 can require a barterer to transfer with the security their estate exemption (or a portion thereof) up to the allowed estate exemption amount (which is currently \$625,000) as a gift. In this case, the barterer is not entitled to this at death. When that individual receives a security in return, the individuals from whom the security came would also have given an estate exemption. Also, the system 100 can be configured to utilize the gift tax exemption. In essence, allowing a barterer to gift up to the maximum non-taxable amount, which is currently \$10,000.00, to each and every individual that they barter with at which time they receive the same amount back in the security such as cash as "a gift". This requires all gift transactions to be less than or equal to \$10,000.

If Section 1031 of the Internal Revenue Code of 1986 is amended to include securities as defined earlier, the present system can be configured to effectuate a tax-deferred exchange should one or both bartering parties desire such. Further, the system 100 can be adapted, modified or changed to utilize or capitalize on any existing or future tax laws.

Per the S.E.C., barter transactions or transfer of rights are not registered. Thus, this system permits bartering in a discrete and/or anonymous manner, (i.e., not informing the public). However, the system 100 is preferably configured to compile historical barter information regarding barter transactions of each barter. Additionally, the system 100 may be modified to meet S.E.C. regulations, if required. Terms and Conditions in a Himmelstein Option can include contingencies for settlement. For example, a Himmelstein Option may be bartered with a contingency that for settlement it must meet SEC approval.

The present system permits any type of securities or financial interests to be bartered, including but not limited to CD's, stocks, bonds, notes, evidences of indebtedness or interest, interests in a partnership, certificate of trust or beneficial interest, etc. The system 100 can interface with or be incorporated as part of online companies in such a fashion that it is transparent to the clients of the online trading company. When a client from an online trading company desires to purchase a particular security, the online trading company may choose to acquire, if available, from another individual who has entered a transaction to barter their security away. The online trading company can act as the intermediary and barter for the security, in essence making the online trading company the system 100 barterer with the ability

to acquire new stock and/or any security, and then sell it to their online client. By doing this, the online company can keep the entire spread between the "ask and bid" with no commissions, and undercuts traditional stock exchanges in price and speed by eliminating intermediaries such as floor brokers or specialists from the trading process.

The system 100 can be configured to handle "exchange funds" often known as "swap funds" or (Private Placement Memorandum) P.P.M. wherein an individual puts in their financial interests or security (such as stock shares) into the fund for exchange units of the entire fund. This allows the individual to diversify their financial interests or securities such as stock holdings without having to pay capital gains taxes. In such a case, the system 100 maintains "system" funds and barterers exchange various financial interests for units of the "system" fund. The system 100 can also be configured to further open and close new funds when deemed necessary by the system or by pre-set parameters.

The system 100 can allow barter orders to require only some security up front at the time of the Himmelstein Option Agreement being consummated. This portion of the security or commodity may or may not be refundable. The balance of the Agreement would only be paid if the Himmelstein Option is finalized, or ownership of the security is transferred.

For example, a posted transaction can state that the Himmelstein Option must occur after 01/05/00 and before 01/06/00 and the barterer is bartering AOL stock for cash or web barter dollars for \$5.00 per share paid immediately which is non-refundable and \$95.00 per share at settlement. Individuals accepting this Himmelstein Option must pay the \$5.00 per share, which is non-refundable. On 01/06/00 if the AOL stock is less than \$95.00 per share, the individual will choose not to exercise their rights in the Agreement, thereby allowing the Agreement to expire. This is to be defined as selling long, in the "virtual stock market", (i.e., system 100).

In an alternative embodiment, the system 100 may allow a barterer to issue a Himmelstein Option on a security that the barterer does not own, nor have a Himmelstein Option (i.e. rights to own) on. If, or when, the Himmelstein Option is chosen (for example, by person "A") the barterer is required to acquire the security or the Himmelstein Option that was being traded away, on or before the date after the barter transaction may occur, to then hand it over to

person "A". This is to be defined as selling short or trading futures in the "virtual stock market" (i.e. system 100).

The virtual market (i.e. system 100) can handle what is referred to in the financial industry as a margin account wherein the system 100 allows the barterer to borrow web barter dollars, cash or issue Himmelstein Options against the value of their portfolio including Himmelstein Options in their possession.

When someone issues a Himmelstein Option, the barter transaction can also allow the person issuing the Himmelstein Option to enter a different before and after date for the Himmelstein Option for the new security desired. Therefore, in this embodiment, the system 100 may require the person posting the transaction for the Himmelstein Option for the security desired to give a specific date before, and a specific date after, or a range of dates that would be acceptable. This range of dates may be disclosed to potential barterers; or in the alternative, can be undisclosed (making a potential barterer be required to choose specific dates, before and after) without knowing the range of dates that the individual posting the Himmelstein Option used.

With respect to the securities that provide dividends, interest etc., the system 100 can further do the following. The system 100 may keep the dividends, interest etc. as part of the transaction, and may put in a common "pool" all dividends, interest etc. realized. A formula is used to proportion the amount between any, and all, clients holding Himmelstein Options for the specific class of items.

The system 100 can require barterers to enter Himmelstein Options or barter orders in round lots. For example, if the security was stock, the system 100 can require increments of 100 shares.

The system 100 can have the ability to break down posted order(s) into specific dollar and or quantity amount(s) allotment and re-post. For example, if the system 100 chose to break down into a specific dollar amount, the system 100 can choose one thousand dollar amount(s) or block(s). If someone posted 10 shares of IBM stock at \$110.00 for each share, the system 100 can re-post to be 2 barter orders: one order to be 9 shares of IBM stock with 10 web barter dollars; and one order with 1 share of IBM stock as the residual amount. In another example, if the system 100 chose to break down into a specific quantity amount in the security "stock", the

system 100 may decide to break down posted orders to allotments of 100 shares and post the remaining portion (if any) that isn't dividable by 100. For example, if the posted order was 1220 shares, the system 100 can re-post to be 13 barter orders: (12) barter orders with 100 shares and (1) barter order with 20 shares. Further, if the system 100 wanted all residual amount(s) to be a specific figure, the system 100 can require the balance of the security plus web barter dollars to always be a specific value. The purpose is to simplify the barter values to be essentially equal to a common value or multiple common values in the system 100 to facilitate more barter transactions.

As a "virtual stock market", the system may allow all securities to be in decimal format or dividable by 100, 1000 etc. This means that even a Himmelstein Option (no matter the security stated in the Himmelstein Option) can be in decimal format or dividable by 100, 1000 etc. Therefore 1.00 = 1 total unit of the particular security. For instance if the security is stock, 1.00 would equal one share of stock for a particular company.

Therefore, any fractional or decimal amount created from a barter transaction can be worth for example, as little as .001 of a web barter dollar or .001 of a U.S. dollar. Specifically, if Individual "A" posted a barter order to barter away 100 shares of AOL stock at \$85.00 per share while desiring IBM shares at \$180 per share, the system may, (if an available match existed or if it was a direct barter with the website) complete the barter order and provide 47.22 IBM shares at \$180.00 per share. In this case, decimal amount of .22 is worth \$39.60, if \$180 is the current stock trading price per share. Alternatively, the system/barterer may allow, depending on the parameters set, barter 99.53 shares of AOL stock for 47 shares of IBM stock.

The system can state in all barter agreements (i.e. terms and conditions) that all parties using the system may accumulate "fractional" or "decimal" amounts (i.e. all values less than (1.00) total unit of a particular security) from different parties and upon the sum equaling 1.00, allow the sum to become 1 unit of a security, such as 1 share of stock. It should be noted that for Himmelstein Options, the system would be required to ensure the latest before dates and latest after dates overlap, and the system would restate the before date and after date to be the latest before date and earliest after date of all the fractional or decimal amounts.

Preferably, the system maintains a history knowing which fractional or decimal amount came from which security, such as stock, and can, when beneficial to the system and/or the barterer, re-separate a unit of a particular security and rematch it back together with a portion of the original security that had been part of the actually split. If for a Himmelstein Option, this may change the range of settlement dates.

Optimally, the system may allow barterers to barter fractional or decimal amounts to other barterers and/or only with the system.

The system 100 may set the standard for minimum transaction and maximum transaction based upon various concerns, including but not limited to, profitability and/or irregularities, illegal trade practices and illegal trade patterns.

The methodology of the "standard" Himmelstein Option is to allow two or more parties to agree at a future date to barter, exchange or sell items or securities based on current agreed values, regardless of the trading values of the securities at the time of settlement. In an alternative embodiment, two or more parties may agree to exchange or barter at a future date based on values on that future date. In this embodiment, the settlement date or dates for each security may yet be a different date.

The system may unilaterally determine, or give each individual barterer, the ability to select a closing price for securities as trading days get longer with extended after-hours trading. For example, if a security was stock, the system may permit an individual to choose the traditional 4:00 P.M. eastern/standard time closing price of the NYSE and the NASDAQ market. On the other hand, the system or individual may choose the value based on after-hours trading. For example with the security, stock, or Himmelstein Option for stock, the system uses the closing price as the current stock trading price as noted on 538, Figure 5D and 506, Figure 5A.

The system 100 can operate 24 hours a day or during standard market hours and/or during predefined after hours trading or a combination thereof. The system 100 can further allow specific securities to be traded/bartered during specific time frames or allow a barterer to choose the hours during which the barterer wants their barter order posted (i.e. available for barter). Furthermore, the barterer or the system may allow the after hours trading market to operate totally independent from the standard market hours session. It may be a selectable

parameter by either the barterer or system to determine whether a barter order posted during standard hours will participate in the after trading sessions and vice versa. Also, the barterer or system can determine if un-executed barter posted orders placed in either the standard or after hours session carries over to the other session or gets canceled.

The system can ensure that barterers remain anonymous from one another and may utilize trustees, assignors or intermediaries to accomplish such.

The system can also allow any barter order to be canceled under specific terms. Further, if the order was not "locked" by a barterer or already processed, the system can permit an individual who created the barter order to cancel or modify same.

The system can also utilize the latest security features and encryption methods available.

The system may permit an individual to post a barter order with a range of quantities acceptable to the individual. For example, if the individual posted IBM stock with a range of 5-10 shares, this means that the system can accept a barter order for any quantity between 5-10 shares. This increases the likelihood of the barter transaction occurring. As will be recognized by those skilled in the art, the fee structure charged by the system may be modified to handle this embodiment.

The system 100 can also conduct or perform auctions wherein the system 100 can further require: 1) a bidder to bid with a specific security; 2) a bidder to bid with a specific list of securities pre-approved; 3) require various conditions on a bidder such as requiring security to be held by the system/designated agent; 4) pre-approve an individual to bid and 5) Minimum bid requirements may exist. The system 100 may use the embodiment that allows "offers" and allows communications between potential barterers using the system's e-mail subsystem.

An agreement for a Himmelstein Option can state various additional conditions such as requiring that the barterer in possession of or in ownership of a Himmelstein Option must first offer or sell same to the system 100 and/or owner of the security prior to going to settlement. The system may allow a barterer creating Himmelstein Options the ability to draft specific conditions to essentially create a custom contract to meet the barterer's needs.

If the system 100 utilizes an intermediary or designated agent, the system 100 has the ability to fully communicate in such fashion to ensure that all securities are transferred back and forth in a proper controlled and secure fashion.

The system can authorize and permit an individual to access the ebarterrealestate.com system and utilize an intermediary, or directly barter for real estate.

Referring now to **Figure 8**, the posted barter order database module 116 stores posted barter orders 806, provides access routines 802 and performs maintenance of the database 804. Among the access routines 802 are add order record, delete order record and get order record.

The add order routine generates a database record that comprises the barter order in addition to a unique transaction number, the time and date stamp of the order and the account number. There are numerous delete routines to remove posted barter orders based on different criteria. Some of the criteria are account number, transaction number, time and date, and barter item. Similarly, the get routine can return records based on the same criteria.

The maintenance program 804 executes periodically, or optionally at the request of and access routine 802, to remove and modify posted barter orders. For example, orders may be modified if a stock split occurs and the barter order designates this stock or a Himmelstein Option for the stock. Orders can be removed for a number of reasons such as the barter order expires, the barter account closes or the barter item is no longer available. For example, a barter order can be removed if stock trading is halted and the barter order designates this stock.

Barter orders are modified by the maintenance program 804 under a number of circumstances. A stock symbol designated in an order may have changed or the account number of the barter order is changed. Optionally, maintenance program 804 generates indexes and tables to facilitate quick access to the database records.

Optionally, if the system included a separate database of each individual's portfolio for all securities, the system can perform similar access routines and maintenance routines as described above.

With reference to Figures 11 and 15, these figures represent alternate graphical user interfaces to those shown in Figures 5A-E, by which users may place barter orders. Figure 12

illustrates a response screen to a barter order which is an alternate graphical user interface to Figure 6, while Figures 13 and 14 illustrate help instructions for that response screen.

One recognizes that many modifications may be made to Figure 12, either in the column headings or in the way that the information in the rows is expressed. For example, additional column headings can include "buy-side shares", "trade price for the buy side/trade-for side" and/or "trade price for the sell side/trade-away side". Also in Fig. 12 on the line where "you save" \$75.00, the savings can be expressed as \$0.075 per sell side/trade-away side share, or \$0.15 per buy side/trade-for side share. The "you save" amount can be either positive or negative. The figure can display another column "equivalent purchase share price" wherein for this line the entry is \$100.10, showing that the user can save \$0.15 per share relative to the buy side/trade-for ask price. In other words, for IBM, \$100.10 = the \$100.25 ask price - \$0.15 savings per share. Likewise, an "equivalent sale share price" can be shown as \$54.20; i.e., for HD, \$54.20 = the \$54.125 bid price + \$0.075 savings per share. The savings per share on the sell side is one half the savings per share on the buy side because twice as many shares are being sold as being bought.

With reference now to Figures 33-54, other alternative graphical user interfaces are shown to those described above. More specifically, Figure 33 shows a control center GUI through which users can enter and process barter orders and populate the order book, or database of posted barter orders, with marketmakers further able to enter and process rules for automatically and/or manually processing barter orders. The information in the help screen of Figure 34 provides an overview of placing and processing barter orders.

The GUI of Figure 35 illustrates the contents of the Order History tab in the Control Center of Figure 33, while the GUI shown in Figure 36 shows the contents of the Saved Orders tab of the Control Center.

Figure 37 shows a GUI accessible by clicking the "trade" option from the Saved Order screen of Figure 36 which provides a trader with the option to place "Trade From Order Book," market order and limit order barter orders. The related instructions in the help screen of Figure 38 describe the various processes of entering and processing a barter order.

The GUI of Figure 39, selectable by clicking the Trade From Order Book button of the

order entry screen of Figure 37, along with related help instructions in the help screen of Figures 42 and 43, provides an interface for viewing and analyzing barter orders available in the limit order book stored in database 116. The Level II Quotes screen of Figure 40 and the Internal and External Offers screen of Figure 41, with the associated help instructions shown in Figures 42 and 43, provide user information for interpreting the level II quotes and internal and external offer information.

In an alternative embodiment of the invention, the system 100 may require a barterer to enter only (1) the symbols for the assets that he wants to barter, and (2) either (a) the ratio of the shares of one asset to the shares of the other asset, or (b) the ratio of the currency value of one asset to the currency value of the other asset. The barterer does not have to enter (1) which symbol corresponds to the buy side and which corresponds to the sell side, or (2) the exact quantities of each asset to be bought and sold.

In the instance where exact quantities of shares or currency values are entered but the asset symbols are not specified as buy side and sell side, marketmaker responses generated by the Marketmaker Toolkit are presented on two sides: one for when the barterer wants to purchase the first-entered asset and one for when the barterer wants to sell the first-entered asset.

In the case where the ratio of share quantities or currency values (rather than exact quantities of shares or currency values) are entered, marketmaker responses generated by the Marketmaker Toolkit are presented on a per-share or per-currency unit basis. There are many variations on how such responses may be generated; for example, (1) price per 100 shares of the buy side asset, and (2) price per US \$1,000 of the sell side asset. Other variations will occur to those skilled in the art. Alternatively, system 100 may require that all entered orders have equal buy side and sell side currency amounts (subject to a non-zero tolerance so that trades may be executed in integer shares, integer currency units, or multiples of these, such as 100-share units). Accordingly, in these embodiments a barterer would enter only the symbol for the assets to be bartered, without indicated shares, currency values, or a ratio thereof. In these embodiments, marketmaker responses generated by the Marketmaker Toolkit are presented on two sides and on a per-share or per-currency unit basis. In a variation of these embodiments, the exact quantity of either the buy side or sell side, but not both, may be entered by the barterer.

With reference to Figures 39, 40 and 41, the savings amount shown in the Limit Order Book's individual offers (and, by extension, the Quick Fill offer) represents the monetary difference realized by a user between trading on offers that include system 100's internal offers ("System Offers"), and trading on offers that are exclusively national market offers/external offers ("Benchmark Offers"). These savings amounts may be computed by a variety of methodologies, depending on what offers are included in System Offers and what the Benchmark Offers are assumed to be. The System Offers may or may not include offers from the national markets. Further, the Benchmark Offers may be based on reasonable hypothetical assumptions. One assumption is that the only national quantities available to trade are those shown directly in the Level II quote system. A second assumption is that the total size of the incoming barter order is available to be traded at the National Best Bid and Offer (NBBO) prices. This assumption would lead to a smaller (or more negative) Savings amount than would the first assumption. A third assumption is that a fixed number of shares is available to trade at every 0.01 price increment for each security in the barter order. Price increments other than 0.01 could also be used. A fourth assumption is to assign a (different) quantity of shares available to trade to each marketmaker, each exchange, and each ECN, shown on the Level II quote system. These and other assumptions may be appropriately used in calculating user savings.

In the lower portion of the Limit Order Book (LOB) shown in Figure 39, the System Offers are ranked from most attractive (top line) to least attractive (bottom line) according to "MSFT Ask" price (in general, this price is the ask price of the buy-side security). This ranking is based on the assumption that a trader can sell the sell-side security on its NBBO bid, and purchase the buy-side security at the variable ask price shown in the System Offer. The higher this ask price, the more the trader must pay and the less attractive the offer becomes.

Other methodologies can be used to rank offers. For example, an assumption can be made that the buy-side security is always purchased at its then-current NBBO ask price, while the sell-side security is sold at a variable bid price. In this case the lower the variable bid price, the more a trader pays (or the less he receives) and the less attractive the internal or external offer. Other methodologies can be used to specify either the buy-side price or the sell-side price at the time an offer is displayed. Examples include (1) the midpoint of a security's NBBO bid

and NBBO offer, (2) a fixed dollar price, such as today's opening trade price, or such as \$50, and (3) a price that depends on the size of the incoming order, such as the NBBO ask price plus 0.01 per 100 shares being purchased. Other methodologies may also be appropriate.

Help information shown in Figure 44 provides user assistance for trading on individual barter orders in the barter order book of Figure 39. One option for trading is to execute a Quick Fill, available through the Quick Fill button shown in Figure 39 as explained in the help screen illustrated in Figure 45 and resulting in the Instant Confirmation screen shown in Figure 46. Figure 47 illustrates a help screen containing information for interpreting the contents of the Instant Confirmation screen of Figure 46.

The user help screens shown in Figures 48, 49 and 50 provide user assistance for trading individual orders from the order book of Figure 39. Note the tables of Figure 49 are illustrated in Figure 50.

With reference now to Figures 51, 52 and 53, the GUI shown in Figure 51, accessible from the Limit Order button of the Order Entry GUI shown in Figure 37, enables a user to enter a limit order for a barter order. The Market Order Entry GUI shown in Figure 52, similarly accessible through the Market Order button of the Order Entry GUI (Figure 37), enables a user to enter a market order for a barter order. The help screen illustrated in Figure 53 provides user assistance relating to both limit and market orders.

Referring now to Figures 10 and 10A, alternative embodiments of the present invention are shown further including marketmaker 120, basket order 121 and contingency order 122 barter tool kit systems ("tool kits"). Like features to those described above are indicated by like reference numbers. Each toolkit utilizes a software program or programs that interface with the system 100.

System 100 of Figure 10A is seen to further include capacity for additional processing modules 123. The system of Figure 10A further includes an application programming interface 124 specific to barter order interface 105 operable through either a web interface 125 or a custom vendor interface 126. As described above, the various computing devices can interface the barter order system through a public or private network connection, optionally through a website web browser.

As will be described in further detail below, the use of the toolkits automates certain processes and functions which otherwise might require significant manual activity. As used herein, the term "automate" and variants including "automated," include the process or operation of notifying an operator that a manual intervention or response is required.

As used herein, a "marketmaker" is any person or system that responds to order flow by making bids and offers on which another person or entity can trade. Such a marketmaker is said to add liquidity to a market when he allows another to trade on his bid or offer. Also in the context of these specifications a "trader" is any person or system that desires to execute a particular order, including a market or limit order, and is looking for another party to make a bid or offer for such order. Such trader is said to remove liquidity from the market when he executes his intended order. Accordingly, any person or system that, in response to order flow, creates an offer that resides on the Limit Order Book (LOB) is deemed to be a marketmaker, and any person or system that attempts to trade against an offer residing on the LOB is deemed to be a trader. Trader-initiated limit orders residing in the system may be executed by marketmaker offers automatically at any time, with or without appearing in the LOB. Consistent with this paragraph, a person institutionally designated as a marketmaker may desire to enter barter orders as a "trader" in the context of these specifications, while a person or entity who is not a broker-dealer may desire to provide offers through the herein-described Marketmaker Toolkit and act as a "marketmaker" in the context of these specifications. Users of system 100 will thus include both traders and marketmakers.

As will be appreciated from consideration of the description below, the toolkits as described herein are operative in many instances to respond to both barter orders and barter order requests for quotes. As used herein the term "barter order request" includes both a barter order and/or a barter order request for quote.

Marketmakers profit by capturing the bid/ask spread on trades, while minimizing the cost of position management or the cost of immediate hedging of these trades. The System 100 is designed to deliver a particularly attractive order in this regard. System 100 order flow carries all of the bid/ask spread profit potential but only a small fraction of the market risk and adverse market impact associated with traditional orders.

System 100 order flow delivers a traditional buy and a traditional sell order simultaneously. For example, a barter order might be to buy \$100,000 of IBM and sell \$90,000 of HON, each contingent on the other. By executing these legs at the same time, the marketmaker generates a profit that is proportional to the dollar sum of both legs, or \$190,000, but generates market exposure that is proportional to the dollar difference between the two legs, or only \$10,000.

Of course, the ultimate attractiveness of a barter order depends on many variables, including the dollar difference between the buy and sell legs, the industry closeness of the stocks, and the liquidity of the two names. System 100 allows marketmakers to use a tool kit, which not only provides the means to measure the attractiveness of any incoming barter order along these and other dimensions, but also to specify how aggressively or passively to respond to it, either on an absolute price and size basis, or in terms of last trade price and size, or in terms of the current NBBO (National Best Bid and Offer) prices and sizes.

A marketmaker tool kit is a system that allows marketmakers to characterize incoming orders by creating or defining their own rules that include (1) conditions that describe an incoming order, and (2) price/size tiers that form automatic quotes or executions to one or more traders' orders if the conditions are satisfied. These automatic quotes and executions bring greater liquidity to the System 100. For example, marketmakers can write a rule that allows them to manually or automatically offer to trade a barter order at a fixed price, or a market-based price, such as 10% of the NBBO spread under the current NBBO offer, in the current NBBO size, whenever the dollar sizes of the buy and sell legs are almost equal and the two securities bartered are in the same industry.

One embodiment of a marketmaker toolkit is embodied in the graphical user interfaces and help screens illustrated in Figures 16 through 20. Another embodiment of a marketmaker toolkit is embodied in the graphical user interfaces and help screens illustrated in Figures 54-76. In the first embodiment, Figure 16 shows a GUI interface by which a marketmaker can establish automatic bid/offer responses. Figure 17 shows a GUI for working with symbols related to the automatic bid/offer responses, while Figures 18, 19 and 20 illustrate help screens containing user instructions for the marketmaker toolkit.

With reference to the second embodiment, Figure 54 illustrates a GUI interface for marketmakers to establish both automated and manual bid/offer responses, with associated help instructions shown in Figure 55. Figures 56 and 57 show a GUI interface and help instructions, respectively, for establishing rules, while Figure 58 shows a GUI interface for establishing conditions in accordance with the help screens shown in Figures 59-61.

Figure 62 shows a GUI through which a marketmaker can establish and edit pricing tiers in accordance with the help information provided in the illustrated help screen of Figure 63.

Figure 64 shows a GUI interface for creating a customized ticker of securities information useful to a marketmaker in accordance with the instructions shown in the help screen of Figure 66. One exemplary ticker is illustrated in Figure 65.

Figure 67 shows a GUI interface for creating a customized position/profit & loss report useful to a marketmaker in accordance with the instructions shown in the help screen of Figure 70. Two exemplary position/profit & loss reports are shown in Figures 68 and 69, respectively.

Figures 71 and 72 show GUIs for establishing manual offers, wherein barter orders that meet the established conditions are provided to the marketmaker for generating a manual response. Associated help instructions are illustrated in the help screen shown in Figure 73.

The barter matching engine 118 incorporates or interfaces with the various rules, conditions and pricing tiers a marketmaker establishes using the marketmaker tool kit shown and described above, to selectively match a barterer's barter order (that is either posted or requesting a quote only) to rules that are pre-defined by a marketmaker, in order to determine which marketmakers are providing automatic quotes or executions. A rule is a list of one or more conditions that may comprise a parameter (variable), an equality or inequality sign (operator), and a constant value (constraint). A parameter is a market-related, portfolio-related, or other type of variable that characterizes an order. For example, the average daily volume of the security being traded away is a parameter. A constant value may be a numerical value or string value (e.g., a security symbol) that places a constraint on a parameter. One condition, for example, can be "Average Daily Dollar Volume of the Stock being Traded Away" \geq \$2 million. Here, the parameter is "Average Daily Dollar Volume of the Stock being Traded

Away", the inequality is "greater than or equal to", and the constant value (constraint) is \$2 million.

Optionally, the tool kit can be set up so as to pre-designate a parameter and an equality or inequality sign, so that a marketmaker may enter only a constant value to create a condition. Likewise, the tool kit can be set up so as to pre-designate any number of the elements of a condition, so that a marketmaker may enter only the remaining element(s) to create the condition.

Alternatively, the tool kit can provide the means for marketmakers to be alerted by system 100 to specific barter orders to which they desire to provide manual responses. See again Figures 71-73 for GUIs and help instructions used to establish manual responses. For example, a marketmaker may use the tool kit to be alerted if an order to barter for at least 10,000 shares of IBM is entered into the system, so that the marketmaker can evaluate the particular barter order and, if desired, can provide a manual quote for said order. Likewise, a marketmaker can use the tool kit to be alerted if a trader is trading away IBM but not if a trader is trading for IBM. Alternatively, a marketmaker can use the tool kit to be alerted if a trader is trading for IBM but not if a trader is trading away IBM. As another example, marketmakers can cause the system 100 to alert them if a barter order comprises two securities that fall within a list of securities that the marketmaker has pre-designated.

Marketmakers can use the marketmaker tool kit to specify exactly how many of the conditions that comprise a rule must be satisfied before an automatic price quote or trade execution is delivered to the system 100. For example, a marketmaker can use the tool kit to specify that an alert is to be sent if exactly two of the following three conditions are satisfied: (1) a trader is trading away IBM, (2) a trader is bartering two stocks that both trade an average daily dollar volume of at least \$2 million, or (3) the dollar amount that is being traded for equals the dollar amount that is being traded away.

The marketmaker tool kit is designed to allow marketmakers either to use parameters already designed for them, or to create customized parameters. Examples of pre-designed parameters are number of shares or lot size, share price, trade volume, risk characteristics, and inclusion within a specified security list. An example of a risk characteristic of a barter order is

"Delta", which measures the amount of market exposure of the order. The Delta is the absolute value of the difference between the currency amounts of the two legs of the barter order, divided by the maximum currency amount. If the trader is trading away a currency amount of US\$100,000 and trading for an amount of US\$75,000, then the Delta is $25\% = |100000 - 75000| / \max(100000, 75000)$. It would be recognized by one skilled in the art that many variations may be made in the structure and mode of operation of the tool kit without departing from the spirit and scope of the invention as disclosed in the teachings herein.

A rule can include both multiple price and size tiers used to generate automatic or manual offers on the Limit Order Book. An example of this is shown in Figure 62, whereby the offer price may be expressed in terms of (1) the then-current NBBO price spreads for the two component securities, and (2) a pre-specified increment. In the example, the offer size may be expressed in terms of (1) the then-current NBBO sizes of the two component securities, and (2) a pre-specified value, based either on numbers of dollars or numbers of shares.

Other methodologies for determining offer price and offer size are also possible. These values may depend on a portion of (or all of) the Level II quotes for the two relevant securities. For example, offer size can be expressed as (1) the sum of the first three offer sizes shown on the Level II quote system, or (2) the size of the first offer from a pre-selected marketmaker, exchange, ECN, or ATS, etc., or (3) the sum of the sizes of all Level II quotes whose price is within 0.02 of the current NBBO offer, or (4) a pre-selected currency amount rounded to a multiple of 100 shares. Variations of these examples are also possible. Furthermore, offer price can be expressed as (1) the average of the first three offer prices shown on the Level II quote system, or (2) the price of the first offer from a pre-selected marketmaker, exchange, ECN, or ATS, etc., or (3) the price of the first Level II quote whose size is at least 1000 shares. It will now be apparent to those skilled in the art that many different variations of these determinants are also possible.

In the matching process, the rules in the marketmaker tool kit functionally operate as a filter to provide barter orders to the appropriate marketmakers. This allows the marketmakers either to post one or more potential trade prices in response to a trader's limit order or quote

request, or to execute a single posted limit order or a combination of posted limit orders (i.e., “phantom” or “implied” limit orders, discussed below).

The contra side of traders’ barter orders may be marketmakers. However, some system 100 order flow can be matched against other orders that are internal to the system. As explained previously, many internal orders may need to be combined to make one execution. For example, an order to sell IBM and buy HON, an order to sell HON and buy CSCO, and an order to sell CSCO and buy IBM, can form a three-way internal match. Likewise, a limit order to sell IBM and buy HON, and a limit order to sell HON and buy CSCO may create an “implied” limit order to sell IBM and buy CSCO, to which a marketmaker may respond, exactly as if the “implied” order were an actual entered barter order.

System 100 may provide traditional order liquidity to an Exchange, ECN or ATS. One illustrative example includes the following two barter orders:

- Buy 1000 MSFT / Sell 2000 INTC / Pay \$0.
- Sell 1000 MSFT / Buy 1000 INTC / Receive \$30,000.
- If these barter orders reside on system 100, the system can post two traditional orders to an Exchange, ECN or ATS:

- Buy 1000 INTC @ \$30.00,
- Buy 500 MSFT @ \$60.00.

System 100 posts the former order so that, if a third party trades against it, it can execute both of the barter orders. That is, a three-way match is formed by these orders:

- Buy 1000 INTC / Pay \$30,000 [first Exchange, ECN or ATS order]
- Buy 1000 MSFT / Sell 2000 INTC / Pay \$0. [first barter order]
- Sell 1000 MSFT / Buy 1000 INTC / Receive \$30,000. [second barter order]

System 100 posts the latter order because if a third party trades against it, then it can execute one barter order in full and one in part. That is, a three-way match is formed by these orders:

- Buy 500 MSFT / Pay \$30,000 [second Exchange, ECN or ATS order]
- Buy 500 MSFT / Sell 1000 INTC / Pay \$0. [1/2 of first barter order]
- Sell 1000 MSFT / Buy 1000 INTC / Receive \$30,000. [second barter order]

It can readily be determined that the number of one-sided limit orders generated by the above

methodology can increase as fast as geometrically with the number of pending barter orders, as long as the orders deal with similar symbols.

The Limit Order Book (LOB) may show offers that are (1) exclusively internal to system 100, (2) exclusively external to the system; i.e., residing on exchanges, the NASDAQ market, ECNs, ATSs, etc., or (3) a combination of internal and external. Whenever a trader chooses to trade against an external offer, he runs the risk that such offer may change before his order reaches the external market and, hence, that he misses the intended trade. Accordingly, the system 100 may allow a trader to pre-select how such a situation will be resolved. The trader may choose between using market orders and using limit orders when his offer cannot be executed against the then-current external offers.

If a trader chooses to use market orders when the intended external offers are not available, his barter order will be split and will be delivered to the external market as two single-security market orders. Consequently, he will be guaranteed a fill of his entire order, although not necessarily at the price of the intended offer. If a trader chooses to use limit orders when the intended external offers are not available, his barter order will be split and will be delivered to the external market as two single-security limit orders. Consequently, the trader will be guaranteed that if a trade takes place it will be at the intended price, although the trader will not necessarily trade the full amount of his intended trade (and in fact, the trader may not trade at all) and the ratio of the quantities of the two securities traded may not equal the ratio specified in the barter order that was placed originally.

One advantage of the present invention is that, in contrast to trading on external offers, whenever a trader trades against an internal offer, he is guaranteed to receive the intended price. Furthermore, although he is not guaranteed to trade the full size of his intended trade, he can be guaranteed to trade in quantities that are in the same ratio as that specified in his original barter order.

In an alternative embodiment, marketmakers, institutional traders and retail traders may use a basket generator tool kit ("basket tool kit") to define a basket of securities that can be sent directly to the market, or bartered against either an individual security or another basket. Graphical user interface and associated help screens illustrating a toolkit for creating basket

orders as described below are shown in Figures 26-32. More specifically, Figure 26 and 27 show GUIs for defining baskets of trade items in accordance with the instructions in the help screen shown in Figure 28. Figure 29 shows a GUI for defining symbols in accordance with the help screen shown in Figure 30, while Figure 31 shows a GUI for establishing fundamental and technical filters in accordance with the user help screen shown in Figure 32.

A basket of securities ("basket") is defined to be at least two different securities, grouped in any combination of descriptions or sizes. The basket tool kit may allow traders to define a basket in terms of its market characteristics or risk characteristics, including fundamental, technical, and macroeconomic factors. Traders may also use the basket tool kit to select securities from existing portfolios. The individual securities' symbols may or may not be explicitly included, explicitly excluded, or a combination of both. In a simple form, the basket tool kit may be used to create a basket of all utility stocks (with no symbols specified) with market capitalization greater than \$1 billion. It may be used to create a basket of all technology stocks with beta to the NASDAQ Composite Index greater than one. In more complex cases, a trader can use the basket tool kit to create a basket equal to all of the bank stocks in the trader's existing portfolio, plus enough 10-year T-bills to bring the total interest rate exposure of the basket to a specified level. Or, a trader can use the basket tool kit to create a basket of \$200,000 of each healthcare stock whose 10-day moving average exceeds its 50-day moving average. Or, the trader can use the basket tool kit to create a portfolio with specified weightings of specific industrial sectors.

It will be recognized by one skilled in the art that many variations may be made in the structure and mode of operation of the basket tool kit for defining baskets of securities without departing from the spirit and scope of the invention as disclosed in the teachings herein.

One also skilled in the art realizes that basket trading can be accomplished without the use of a basket tool kit. In one embodiment, the order entry screen can provide the trader a button to click, which indicates that a basket trade is being entered. The order entry screen may request traders to enter the number of securities to be included in the basket; or, in the alternative, may allow multiple entries of securities until such time that a null entry is made.

When entering a basket, traders can include the respective number of shares or currency amounts of each security, plus either a limit price for each security, or an overall limit price for the basket. The traders may specify the ratio among the securities; or, in the alternative, the system calculates the ratio among the securities. This allows traders the ability to barter a basket as if it were a single security (i.e., trade away one security or a basket for one security or a basket). As the subsequent example demonstrates, a basket can be automatically executed based on the derived or implied ("implied") bids or offers for the different securities within the basket. This allows the trader not to have to monitor the price movements of the different securities continuously.

For example, a trader creates a basket, which has two securities: MSFT and HD noting 500 shares of each and an overall limit price for the basket of \$87,500. If traders wanted to sell the basket, they can enter this as a sell order. If traders wanted to barter this basket away, they can enter this as a barter order and state this as the "trade away" item. Upon the order's being entered, the system automatically generates two implied orders based on the overall limit price of the basket and current market prices for the two individual securities. For example, if a trader enters an order to sell the basket, and if MSFT has a bid price of \$100.40 and an ask price of \$100.55 and HD has a bid price of \$74.30 and an ask price of \$74.60, then the system generates two implied offers. For MSFT, an implied offer to sell 500 at \$100.70 is generated. The MSFT offer price is calculated as $[(\text{Overall sell limit for the basket}) - (\text{HD shares}) * (\text{HD bid price})] / (\text{MSFT shares})$. Numerically, this formula produces: $(\$87,500 - 500 * \$74.30) / 500$, or \$100.70. Therefore, if this implied MSFT order can be executed then the total basket can be executed because the remaining part of this basket order can be simply executed against the market bid for HD of \$74.30. Similarly, an implied offer to sell 500 HD at \$74.60 is created in response to the current market bid for MSFT of 100.40. That is, the HD offer price is $(\$87,500 - 500 * \$100.40) / 500$. These implied orders are monitored and recalculated continuously as market prices change. For example, if the current market bid for MSFT changes to \$100.60, the implied offer for HD changes to \$74.40. When someone enters a bid that matches one of the implied offers, all remaining securities in the basket are automatically filled at the current market offers. At execution, all remaining implied orders are deleted from the system.

In another alternative embodiment, traders may use a contingent order delivery tool kit ("contingency tool kit") as a means to control the timing of the delivery of an order (buy, sell, or barter order) and the definition of its limit, based on current and historical market data for any security, not just the primary order security. Traders may also use a contingency tool kit as a means to control the timing of the delivery of a barter order request for quote. Exemplary graphical user interfaces and help screens associated with a contingency order toolkit are shown in Figures 21 through 25. More specifically, Figure 21 shows a GUI for defining an order contingency in accordance with the help screen instructions illustrated in Figures 22 and 23. Figure 24 shows a GUI for sending a contingent order to system 100 in accordance with the instructions shown in the help screen illustrated in Figure 25.

The primary order (i.e., excluding the contingency) can be a market order, a traditional limit order with a pre-set limit, or a new type of limit order where the limit is market-dependent and may change in real time.

Basic examples of the new type of limit order are:

- Buy xxx shares of IBM at the then-current offer (i.e., when the contingency is satisfied).
- Buy xxx shares of IBM at the 10-day moving average.
- Buy xxx shares of IBM at today's low.

A case where the limit of a non-contingent order depends on other than IBM data is: Buy ... IBM at yesterday's closing price plus (Beta of IBM vs. SPY)*(today's % price change in SPY).

The contingencies can look like anything (IBM is the primary order symbol):

- Submit order if QQQ is at its daily low after 3:45pm.
- Submit order if CSCO and SUNW are each up at least 2%.
- Submit order if SPY rises above its 20-day moving average.
- Submit order if QQQ/SPY ≥ 0.25 .
- Submit order if IBM falls to its first Fibonacci retracement level. (or other types of technical indicators.)

The contingency tool kit can also be based on fundamental data, like earnings announcements.

It will be recognized by one skilled in the art that many variations may be made in the structure and mode of operation of the contingency tool kit (for defining the timing and limit based on current and historical market data for any security, not just the primary order security) without departing from the spirit and scope of the invention as disclosed in the teachings herein.

It is the intention of the inventors that the basket tool kit and the contingency tool kit may be used jointly or severally with both traditional (single-security buy and sell) orders and barter orders. It is further the intention of the inventors that the marketmaker tool kit may be used with traditional (single-security buy and sell) orders, basket order, and a user bartering a basket for another basket ("barter basket order"). Although the tool kit was described in detail for use with a barter order, it also can apply to the above types of orders. Changes apparent to those skilled in the art can be made to the tool kit to adapt to each of these types of orders. For example, marketmakers can have the ability to encode procedures for responding to traditional (single-security buy and sell) orders (with either a bid or an offer, as appropriate) based on various characteristics. The characteristics of an incoming order that can be assessed by the described system include:

- action (buy or sell), price, and quantity of the order;
- the current NBBO "picture" of the incoming security; that is, last trade, bid price, ask price, bid size, ask size, daily price change, and last tick (i.e., uptick or downtick);
- current information about Level II quotes for the incoming security (e.g., SLKC bidding for 1000 shares five cents below the NBBO bid),
- historical price information (e.g., 30-day percentage price move, current 20-day moving average),
- historical technical indicators (e.g., current level of Fibonacci retracement lines),
- current and historical fundamental information (e.g., price/earnings ratio, five year earnings growth rate),
- marketmakers' current inventory information (e.g., currently short 2000 MSFT, currently long \$2 million of securities in NASDAQ 100 index),

-- marketmakers' historical trade information (e.g., bought 5000 MSFT today, sold 10,000 INTC in last 5 minutes, bought \$500,000 of securities in NASDAQ 100 index today), and
-- price, technical, and fundamental information about the general market (e.g., Dow industrials down 50 points today).

Marketmakers are able to set up price/size tiers for automatic responses and are further able to set up Marketmaker Toolkit Monitors (Trade Tickers, and Position and P&L Reports) as they do for two-sided orders. Responses can be placed automatically, that is without directly viewing the incoming order, or manually.

In another example, should a marketmaker be using the tool kit for a barter basket order, the marketmaker may have the tool kit describe a basket order in terms of industry composition and certain risk characteristics with or without revealing industry symbols and/or individual symbol amounts.

It will be understood that while the illustration of the marketmaker, basket and contingency order toolkits has been described above with respect to the creation and execution of barter orders for stocks, the invention is not limited to barter orders but contemplates all manner of other trades. Further, the invention is applicable to all classes of items and securities described in Figure 9, including but not limited to, (1) currencies, (2) fixed income securities such as bonds, convertible bonds, and preferred stocks, (3) spot and forward energy, metal, grain, and soft commodities, and (4) futures on equities, bonds, currencies, and commodities, and indexes of these assets. The only requirement for using the marketmaker toolkit is that the assets that comprise a barter order must have publicly available, real-time disseminated market information associated with them.

If the disseminated market information on an asset includes a bid, an offer, a bid size, and an offer size, then the marketmaker toolkit can be used just as for equities, except with different asset lists and different Condition Variables used to describe the asset. For example, one of the conditions used to describe a bond is "Time to Maturity", which is not an equity Condition Variable.

If the disseminated market information on an asset includes a bid and offer, but not bid size and offer size, then the marketmaker toolkit price/size tiers may not be based on current size

information. However, the price/size tiers can be based on the marketmaker's desired trade size. For example, instead of a price/size tier being expressed as "90% of the NBBO spread / \$20,000 plus NBBO offer size", it can be expressed as "90% of the NBBO spread / \$50,000".

If the disseminated market information on an asset does not include a bid and offer, then the marketmaker toolkit price/size tiers may not be based on this information. However, the price/size tiers can be based on the price at which the asset last traded. For example, instead of a price/size tier being expressed as "90% of the NBBO spread / \$50,000", it can be expressed as "Last Trade + 0.01 / \$50,000".

Other modifications, configurations and adaptations will be apparent to those of ordinary skill in the art and are within the scope of the present invention.

What is claimed is:

1. A method operable on a computer for responding to a barter order, the barter order including a first security to be sold in a barter and a second security to be purchased in the barter, the method comprising the steps of:
 - 5 receiving a rule including at least one condition for automatically responding to the barter order;
 - comparing on the computer the barter order to the at least one condition comprising the rule; and
 - 10 automatically responding to the barter order in accordance with the at least one condition of the rule.
2. A method in accordance with claim 1 wherein:
 - 15 at least one of the first security or the second security includes a quantity thereof; and the barter order further including an effective time range.
3. A method in accordance with claim 1 wherein the at least one condition includes at least one variable selected from the group of variables including: the identity of one or more of the first and second securities, the delta between the buy and sell prices of the first and second securities, the relationship of the SIC codes of the first or second securities or any other securities, the market cap of the first or second securities, the average daily volume traded of the first or second securities and the debit value of the bid/ask spread of the first and second securities.
- 20 4. A method in accordance with claim 3 wherein each of the conditions further includes a mathematical operator and a value.
- 25 5. A method in accordance with claim 1 wherein:
 - each of the rules further includes at least one pricing tier comprising an offer price range
 - 30 within which a rule is operative and an offer size value up to which a rule is operative; and

if the rule is operative and if the at
comprising the steps of:

if the barter offer is a limit order, performing one of the steps of
trading the first and second securities, and
posting the barter offer for consideration for execution;

if the barter offer is a market order, trading the first and second securities; and
if a contra barter offer is accepted, trading the first and second securities.

5 6. A method in accordance with claim 1 wherein the step of automatically
10 responding includes prompting the operator to provide a manual response.

7. A system for responding to a barter order, the system comprising:

a processor;
a memory operatively connected to the processor and storing the barter order

15 including a first security to be sold in the barter and a second security to be purchased in
the barter;

said memory further storing a rule including at least one condition for automatically
responding to the barter order;

the processor operative with control instructions stored in the memory to perform the
20 steps of

comparing on the computer the barter order to the at least one condition
comprising the rule; and

automatically responding to the barter order in accordance with the at least one
condition of the rule.

25 8. A system in accordance with claim 7 wherein:
at least one of the first security or the second security includes a quantity thereof; and
the barter order further including an effective time range.

30 9. A system in accordance with claim 7 wherein the at least one condition includes
at least one variable selected from the group of variables including: the identity of one or

more of the first and second securities between the buy and sell prices of the first and second securities, the relationship of the SIC codes of the first or second securities or any other securities, the market cap of the first or second securities, the average daily volume traded of the first or second securities and the debit value of the 5 bid/ask spread of the first and second securities.

10. A system in accordance with claim 9 wherein each of the conditions further includes a mathematical operator and a value.

10 11. A system in accordance with claim 7 wherein each of the rules further includes at least one pricing tier comprising an offer price range within which a rule is operative and an offer size value up to which a rule is operative; and if the rule is operative and if the at least one condition of the rule is satisfied, further comprising the steps of:

15 if the barter offer is a limit order, performing one of the steps of trading the first and second securities, and posting the barter offer for consideration for execution; if the barter offer is a market order, trading the first and second securities; and if a contra barter offer is accepted, trading the first and second securities.

20 12. A system in accordance with claim 7 wherein the step of automatically responding includes prompting the operator to provide a manual response.

25 13. A method for responding to a barter order, the barter order including a first security to be sold in a barter and a second security to be purchased in the barter, the method comprising the steps of: receiving a rule for automatically responding to the barter order; comparing the barter order to the at least one condition comprising the rule; and automatically responding to the barter order in accordance with the at least one condition 30 of the rule.

14. A system for responding to , the barter order including a first security to be sold in a barter and a second security to be purchased in the barter, the system comprising:

means for receiving a rule including at least one condition for automatically

5 responding to the barter order;

means for comparing the barter order to the at least one condition comprising the rule; and

means for automatically responding to the barter order in accordance with the at least one condition of the rule.

10

15. A method operable on a computer for establishing rules to respond to a barter order, the barter order including a first security to be sold in a barter and a second security to be purchased in the barter, the method comprising the steps of:

storing on said computer a plurality of variables and a plurality of operators;

15 receiving through a graphical user interface input from a user selecting from the plurality of variables and operators to form at least one condition; and

responsive to the input, selecting the at least one condition to form a rule for automatically responding to the barter order.

20 16. A method in accordance with claim 15 wherein:

at least one of the first security and the second security includes a quantity thereof; and

the barter order further including an effective time range.

25 17. A method in accordance with claim 15 wherein the input from the user includes selecting at least one variable from the plurality of variables, at least one operator from the plurality of operators and at least one constraint to form the at least one condition.

18. A method in accordance with claim 17 wherein the plurality of variables includes:

30 the identity of one or more of the first and second securities, the delta between the buy and sell prices of the first and second securities, the relationship between the SIC codes

of the first or second securities or ~~the market cap of the first or second securities, the average daily volume traded of the first or second securities and the debit value of the bid/ask spread of the first and second securities.~~

5 19. A method in accordance with claim 15 wherein the rule further includes at least one pricing tier comprising an offer price range within which a rule is operative and an offer size value up to which a rule is operative.

10 20. A system for establishing rules to respond to barter orders, comprising:

a processor;
a memory operatively connected to said processor and storing a barter order, the barter order including a first security to be sold in a barter and a second security to be purchased in the barter;

the memory further storing a plurality of variables and a plurality of operators, the memory further storing instructions operable with the processor to cause the processor to perform the steps of:

receiving through a graphical user interface input from a user;
responsive to the input, selecting from the plurality of variables and operators to form at least one condition; and

20 responsive to the input, selecting the at least one condition to form a rule for automatically responding to the barter order.

25 21. A system in accordance with claim 20 wherein:
at least one of the first security and the second security includes a quantity thereof; and
the barter order further including an time date range.

22. A system in accordance with claim 20 wherein the selecting step includes selecting at least one variable from the plurality of variables, at least one operator from the plurality of operators and at least one constraint to form the at least one condition.

23. A system in accordance with claim 20 wherein the plurality of variables includes:
the identity of one or more of the first and second securities, the delta between the buy
and sell prices of the first and second securities, the relationship between the SIC codes
of the first or second securities or any other securities, the market cap of the first or
5 second securities, the average daily volume traded of the first or second securities and the
debit value of the bid/ask spread of the first and second securities.

24. A system in accordance with claim 20 wherein the rule further includes at least one
pricing tier comprising an offer price range within which a rule is operative and an offer
10 size value up to which a rule is operative.

25. A method for establishing rules to respond to a barter order, the barter order
including a first security to be sold in a barter and a second security to be purchased in
the barter, the method comprising the steps of:
15 storing a plurality of variables and a plurality of operators;
receiving input from a user;
responsive to the input, selecting from the plurality of variables and operators to
form at least one condition; and
responsive to the input, selecting the at least one condition to form a rule for
20 automatically responding to the barter order.

26. A system for establishing rules to respond to a barter order, the barter order
including a first security to be sold in a barter and a second security to be purchased in
the barter, comprising:
25 means for storing a plurality of variables and a plurality of operators;
means for receiving input from a user;
means, responsive to the input, for selecting from the plurality of variables and
operators to form at least one condition; and
means, responsive to the input, for selecting the at least one condition to form a
30 rule for automatically responding to the barter order.

27. A method operable on a computer system for generating a list of barter order trade information, comprising the steps of:

5 maintaining a database of barter order trades, each of the barter order trades including a plurality of trade parameters, the plurality of trade parameters including a first security including a quantity of the first security sold in the barter and a second security including a quantity of the second security purchased in the barter;

10 receiving at least one selection parameter;

15 using the at least one selection parameter to identify selected barter order trades from the database of barter order trades; and

20 outputting at least one trade parameter for each of the selected barter order trades.

28. A method in accordance with claim 27 and further including the step of:

25 receiving a designated trade parameter; and

30 said outputting step including outputting the designated trade parameter.

29. A method in accordance with claim 27 wherein the step of outputting the at least one trade parameter includes displaying the at least one trade parameter in a real-time human-readable list.

30. A method in accordance with claim 27 wherein the at least one selection parameter is selected from the group comprising: all trades, trades including a symbol, trades including at least one symbol from a list of symbols, trades invoked by rules, and trades in a tier.

31. A method in accordance with claim 28 wherein the plurality of trade parameters further includes at least one trade parameter selected from the group comprising: a symbol, a share quantity, a dollar value, a trade price, a rule invoked, a price tier and a time stamp.

32. A system for generating a list of barter order trade information, comprising:

35 a processor;

a memory operatively connected to a processor and storing a database of barter order trades, each of the barter order trades including a plurality of trade parameters, the plurality of trade parameters including a first security including a quantity of the first security sold in the barter and a second security including a quantity of the second security purchased in the barter;

the processor operative with control instructions stored in said memory to perform the steps of:

- receiving at least one selection parameter;
- using the at least one selection parameter to identify selected barter order trades from the database of barter order trades; and
- outputting at least one trade parameter for each of the selected barter order trades.

33. A system in accordance with claim 32 and further including the step of:

receiving a designated trade parameter; and

said outputting step including outputting the designated trade parameter.

34. A system in accordance with claim 32 wherein the step of outputting the at least one trade parameter includes displaying the at least one trade parameter in a real-time human-readable list.

20

35. A system in accordance with claim 32 wherein the at least one selection parameter is selected from the group comprising: all trades, trades including a symbol, trades including at least one symbol from a list of symbols, trades invoked by rules, and trades in a tier.

25

36. A system in accordance with claim 33 wherein the plurality of trade parameters further includes at least one trade parameter selected from the group comprising: a symbol, a share quantity, a dollar value, a trade price, a rule invoked, a price tier and a time stamp.

30

37. A method in accordance with claim 32 and further including outputting an

indicator that two trades were exer

38. A method for generating a list of barter order trade information, comprising the steps of:

5 storing a plurality of barter order trades, each of the barter order trades including a plurality of trade parameters, the plurality of trade parameters including a first security including a quantity of the first security sold in the barter and a second security including a quantity of the second security purchased in the barter ;
receiving at least one selection parameter;
10 using the at least one selection parameter to identify selected barter order trades from the database of barter order trades;
receiving at least one trade parameter; and
outputting at least the one trade parameter for each of the selected barter order trades.

15 39. A system for generating a list of barter order trade information, comprising:

means for maintaining a database of barter order trades, each of the barter order trades including a plurality of trade parameters, the plurality of trade parameters including a first security including a quantity of the first security sold in the barter and a second security including a quantity of the second security purchased in the barter ;
means for receiving at least one selection parameter;
means for using the at least one selection parameter to identify selected barter order trades from the database of barter order trades;
means for receiving at least one trade parameter; and
25 means for outputting at least the one trade parameter for each of the selected barter order trades.

40. A method operable on a computer for generating a list of barter order trade information from a database of barter order trades, each of the barter order trades

30 including a plurality of trade parameters, the plurality of trade parameters including a first security, a quantity of the first security sold in the trade, a second security, and a quantity

of the second security purchased in

method comprising the steps of:

providing through a graphical user interface at least one selection parameter to identify selected barter order trades from the database of barter order trades; and

receiving at least one trade parameter for each of the selected barter order trades

5 in a real-time, human-readable ticker format.

41. A method in accordance with claim 40 and further including the step of:

identifying a designated trade parameter; and

said receiving step including receiving the designated trade parameter.

10

42. A method in accordance with claim 41 wherein the plurality of trade parameters further includes at least one trade parameter selected from the group comprising: a symbol, a share quantity, a dollar value, a trade price, a rule invoked, a price tier and a time stamp.

15

43. A method in accordance with claim 40 wherein the at least one selection parameter is selected from the group comprising: all trades, trades including a symbol, trades including at least one symbol from a list of symbols, trades invoked by rules, and trades in a tier.

20

44. A method in accordance with claim 40 and further including an indicator that two trades were executed as a pair.

25

45. A system for generating a list of barter order trade information, comprising:

a processor;

a memory connected to the processor and storing a plurality of barter order trades, each of the barter order trades including a plurality of trade parameters, the plurality of trade parameters including a first security, a quantity of the first security sold in the trade, a second security, and a quantity of the second security purchased in the trade;

30

the processor operative with control instructions stored in the memory to perform the steps of

providing through a graphic interface at least one selection parameter to identify selected barter order trades from the database of barter order trades; and receiving at least one trade parameter for each of the selected barter order trades in a real-time, human-readable ticker format.

5

46. A system in accordance with claim 45 and further including the step of: identifying a designated trade parameter; and said receiving step including receiving the designated trade parameter.

10

47. A system in accordance with claim 46 wherein the plurality of trade parameters further includes at least one trade parameter selected from the group comprising: a symbol, a share quantity, a dollar value, a trade price, a rule invoked, a price tier and a time stamp.

15

48. A system in accordance with claim 45 wherein the at least one selection parameter is selected from the group comprising: all trades, trades including a symbol, trades including at least one symbol from a list of symbols, trades invoked by rules, and trades in a tier.

20

49. A system in accordance with claim 45 and further including an indicator that two trades were executed as a pair.

25

50. A method for generating a list of barter order trade information from a database of barter order trades, each of the barter order trades including a plurality of trade parameters, the plurality of trade parameters including a first security, a quantity of the first security sold in the trade, a second security, and a quantity of the second security purchased in the trade, the method comprising the steps of:

30

providing at least one selection parameter to identify selected barter order trades from the database of barter order trades; and receiving at least one trade parameter for each of the selected barter order trades.

51. A system for generating a barter trade information, comprising:
means for storing a plurality of barter order trades, each of the barter order trades including a plurality of trade parameters, the plurality of trade parameters including a first security, a quantity of the first security sold in the trade, a second security, and a quantity of the second security purchased in the trade;
means for providing at least one selection parameter to identify selected barter order trades from the database of barter order trades; and
means for receiving at least one trade parameter for each of the selected barter order trades.

10

52. A method operable on a computer for generating reports, the method comprising the steps of:

receiving on the computer a plurality of barter order requests, each barter order request including a first security including a quantity thereof to be sold in the barter and a second security including a quantity thereof to be purchased in the barter;

receiving at least one rule for automatically responding to a barter order request;
processing the plurality of barter order requests in accordance with the at least one rule; and

generating a report relating to the plurality of barter order requests processed in accordance with the at least one rule.

53. A method in accordance with claim 52 wherein the processing step includes trading or not trading to fill each of the plurality of barter order requests in accordance with the at least one rule; and

25 the report is a profit and loss report indicating profits or losses occurring from the processing step.

54. A method in accordance with claim 52 wherein the barter order further including an effective time range.

30

55. A method in accordance with claim 52 wherein the report is sorted by at least one

of the group comprising a: stock s: rule and tier, and transaction total.

56. A method in accordance with claim 52 wherein the report includes executed barter order requests selected from the group comprising: all trades, trades including a specified symbol, trades including a symbol selected from a list of symbols, trades invoked by a rule and trades in a selected price/size tier.

57. A method in accordance with claim 52 wherein the report includes only trades within a specified time period.

10

58. A method in accordance with claim 52 wherein the report includes data selected from the group comprising: share inventory, price inventory, number of trades, total profits and losses, realized profits and losses, unrealized profits and losses, an identifier of the rule invoked and an identifier of the price/size tier for a trade.

15

59. A system for generating reports, comprising:
a processor;
a memory operatively connected to the processor, the memory storing a plurality of barter order requests, each barter order request including a first security including a quantity thereof to be sold in the barter and a second security including a quantity thereof to be purchased in the barter;
the processor operative with control instructions stored in the memory to perform the steps of:
receiving at least one rule for automatically responding to a barter order request;
processing the plurality of barter order requests in accordance with the at least one rule; and
generating a report relating to the plurality of barter order requests processed in accordance with the at least one rule.

30 60. A system in accordance with claim 59 wherein the processing step includes trading or not trading to fill each of the plurality of barter order requests in accordance

with the at least one rule; and

the report is a profit and loss report indicating profits or losses occurring from the processing step.

5 61. A system in accordance with claim 59 wherein the step of receiving at least one rule includes receiving the rule through a graphical user interface.

62. A system in accordance with claim 59 wherein the barter order request further includes an effective time range.

10

63. A system in accordance with claim 59 wherein the report is sorted by at least one of the group comprising a: stock symbol, rule, rule and tier, and transaction total.

15 64. A system in accordance with claim 59 wherein the report includes executed barter order requests selected from the group comprising: all trades, trades including a specified symbol, trades including a symbol selected from a list of symbols, trades invoked by a rule and trades in a selected price/size tier.

20 65. A system in accordance with claim 59 wherein the report includes only trades within a specified time period.

25 66. A system in accordance with claim 59 wherein the report includes data selected from the group comprising: share inventory, price inventory, number of trades, total profits and losses, realized profits and losses, unrealized profits and losses, an identifier of the rule invoked and an identifier of the price/size tier for a trade.

30 67. A method for generating reports, the method comprising the steps of:
receiving a plurality of barter order requests, each barter order request including a first security including a quantity thereof to be sold in the barter and a second security including a quantity thereof to be purchased in the barter;
receiving at least one rule for automatically responding to a barter order request;

processing the plurality of barter order requests in accordance with the at least one rule; and

generating a profit and loss report relating to the plurality of barter order requests processed in accordance with the at least one rule.

5

68. A system for generating reports, comprising:
means for receiving a plurality of barter order requests, each barter order request including a first security including a quantity thereof to be sold in the barter and a second security including a quantity thereof to be purchased in the barter;

10

means for receiving at least one rule for automatically responding to a barter order request;
means for processing the plurality of barter order requests in accordance with the at least one rule; and

15

means for generating a profit and loss report relating to the plurality of barter order requests processed in accordance with the at least one rule.

69. A method operable on a computer for generating reports, the method comprising the steps of:

20 generating through a graphical user interface at least one rule for automatically responding to a plurality of barter order requests, each barter order request including a first security including a quantity thereof to be sold in the barter and a second security including a quantity thereof to be purchased in the barter; and

25 requesting through a graphical user interface a report relating to the plurality of barter order requests.

70. A method in accordance with claim 69 wherein each barter order request further including an effective time range.

71. A method in accordance with claim 69 wherein the report is a profit and loss report; and further including the step of
30 receiving the report in human-readable format.

72. A method in accordance with claim 71 wherein the report is sorted by at least one of the group comprising at least one: stock symbol, rule, rule and tier and transaction total.

5

73. A method in accordance with claim 71 wherein the report includes executed barter order requests selected from the group comprising: all trades, trades including a specified symbol, trades including a symbol selected from a list of symbols, trades invoked by a rule and trades in a selected price/size tier.

10

74. A method in accordance with claim 71 wherein the report includes only trades within a specified time period.

15

75. A method in accordance with claim 71 wherein the report includes data selected from the group comprising: share inventory, price inventory, number of trades, total profits and losses, realized profits and losses, unrealized profits and losses, an identifier of the rule invoked and an identifier of the price/size tier for a trade.

20

76. A system for generating reports, comprising:
a processor;
a memory connected to the processor and storing a plurality of barter order requests, each barter order request including a first security including a quantity thereof to be sold in the barter and a second security including a quantity thereof to be purchased in the barter;
said processor operative with instructions in said memory to perform the steps of generating through a graphical user interface at least one rule for automatically responding to the plurality of barter order requests; and
requesting a report relating to the plurality of barter order requests.

25

77. A system in accordance with claim 76 wherein each barter order further includes an effective time range.

30

78. A system in accordance with claim 76 wherein the report is a profit and loss report; and further including the step of receiving the report in human-readable format.

5

79. A system in accordance with claim 78 wherein the report is sorted by at least one of the group comprising a stock symbol, rule, rule and tier and transaction total.

80. A system in accordance with claim 78 wherein the report includes executed barter order requests selected from the group comprising: all trades, trades including a specified symbol, trades including a symbol selected from a list of symbols, trades invoked by a rule and trades in a selected price/size tier.

81. A system in accordance with claim 78 wherein the report includes only trades within a specified time period.

82. A system in accordance with claim 78 wherein the report includes data selected from the group comprising: share inventory, price inventory, number of trades, total profits and losses, realized profits and losses, unrealized profits and losses, an identifier of the rule invoked and an identifier of the price/size tier for a trade.

83. A method for generating reports, comprising the steps of: generating at least one rule for automatically responding to a plurality of barter order requests, each barter order request including a first security including a quantity thereof to be sold in the barter and a second security including a quantity thereof to be purchased in the barter; and requesting a profit and loss report relating to the plurality of barter order requests.

84. A system for generating reports, comprising: means for generating at least one rule for automatically responding to a plurality of barter order requests, each barter order request including a first security including a

quantity thereof to be sold in the barter and a second security including a quantity thereof to be purchased in the barter; and

means for requesting a profit and loss report relating to the plurality of barter order requests.

5

85. A method operable on a computer for responding to a submitted barter order request, the method comprising the steps of:

receiving on the computer the submitted barter order request including a first security to be sold in the barter and a second security to be purchased in the barter;

10

identifying on the computer at least two contra barter orders together sufficient to satisfy at least a portion of the submitted barter order request; and

executing trades specified by the submitted barter order request and each of the at least two contra barter orders;

whereby to satisfy at least a portion of the submitted and contra barter order requests.

15

86. A method in accordance with claim 85 wherein:

each first security in the submitted and contra barter order requests includes a quantity thereof; and

20

each submitted and contra barter order request further including an effective time range.

25

87. A method in accordance with claim 86 wherein the at least two contra barter order requests include in combination the first and second securities in quantities and within a date range sufficient to satisfy the submitted barter order request; and

the step of executing trades satisfies the submitted barter order request.

30

88. A system for responding to a submitted barter order request, comprising:

a processor;

a memory connected to the processor and storing a plurality of contra barter order requests;

the processor operative will follow the instructions in the memory to perform the steps of

receiving the submitted barter order request including a first security to be sold in the barter and a second security to be purchased in the barter.

5 identifying from the plurality of barter order requests at least two contra barter order requests together sufficient to satisfy at least a portion of the submitted barter order request; and

executing trades specified by the submitted barter order request and each of the at least two contra barter order requests;

10 whereby to satisfy at least a portion of the submitted and contra-barter order requests.

89. A system in accordance with claim 88 wherein:

each first security in the submitted and contra barter order requests includes a

15 quantity thereof; and

each submitted and contra barter order request further including an effective time range.

90. A system in accordance with claim 89 wherein the at least two contra barter order requests include in combination the first and second securities in quantities and within a date range sufficient to satisfy the submitted barter order request; and

the step of executing trades satisfies the submitted barter order request.

receiving the submitted barter order request including a first security to be sold in the barter and a second security to be purchased in the barter.

identifying at least two contra barter order requests together sufficient to satisfy at least a portion of the submitted barter order request; and

30 executing trades specified by the submitted barter order request and each of the at least two contra barter order requests;

whereby to satisfy at least a portion of the submitted and contra barter order requests.

92. A system for responding to a submitted barter order request, comprising:

- 5 means for receiving the submitted barter order request including a first security to be sold in the barter and a second security to be purchased in the barter;
- means for identifying at least two contra barter order requests together sufficient to satisfy at least a portion of the submitted barter order request; and
- means for executing trades specified by the submitted barter order request and each of the at least two contra barter order requests;

10 whereby to satisfy at least a portion of the submitted and contra barter order requests.

93. A method operable on a computer for responding to a submitted barter order request, the method comprising the steps of:

- receiving on the computer the submitted barter order request including a first security to be sold in the barter and a second security to be purchased in the barter;
- comparing the submitted barter order request to a plurality of contra barter order requests;
- 20 if the submitted barter order request cannot be satisfied by one or more of the plurality of contra barter order requests, splitting the submitted barter order request into a buy order and a sell order; and
- executing the buy order and sell order on an open market exchange.

25 94. A method in accordance with claim 93 wherein:

- at least one of the first security and the second security includes a quantity thereof; and
- the barter order further including an effective time range.

30 95. A method in accordance with claim 93 wherein the submitted barter order includes a limit price for at least one of the first and second securities; and

at least one of the buy and a limit order.

96. A method in accordance with claim 93 wherein at least one of the buy and sell orders is a market order.

5

97. A system for responding to a submitted barter order request, comprising:
a processor;
a memory connected to the processor and storing a plurality of contra barter order requests, each of the contra barter order requests including a first security to be sold in the barter and a second security to be purchased in the barter;
the processor operative with control instructions stored in the memory to perform the steps of
receiving the submitted barter order request,
comparing the submitted barter order request to the plurality of contra barter order requests;
if the submitted barter order request cannot be satisfied by one or more of the plurality of contra barter order requests, then splitting the submitted barter order request into a buy order and a sell order; and
executing the buy order and sell order on an open market exchange.

20

98. A system in accordance with claim 97 wherein:
at least one of the first security and the second security includes a quantity thereof; and
the barter order further including an effective time range.

25

99. A system in accordance with claim 97 wherein the submitted barter order includes a limit price for at least one of the first and second securities; and
at least one of the buy and sell orders comprising a limit order.

30 100. A system in accordance with claim 97 wherein at least one of the buy and sell orders is a market order.

101. A method for responding to a submitted barter order request, the method comprising the steps of:

receiving the submitted barter order request including a first security to be sold in
5 the barter and a second security to be purchased in the barter,

comparing the submitted barter order request to a plurality of contra barter order
requests;

if the submitted barter order request cannot be satisfied by one or more of the
plurality of contra barter order requests, then splitting the submitted barter order request
10 into a buy order and a sell order; and

executing the buy order and sell order on an open market exchange.

102. A system for responding to a submitted barter order request, comprising:

means for receiving the submitted barter order request including a first security to
15 be sold in the barter and a second security including a quantity thereof to be purchased in
the barter,

means for comparing the submitted barter order request to a plurality of contra
barter order requests;

means, if the submitted barter order request cannot be satisfied by one or more of
20 the plurality of contra barter order requests, for splitting the submitted barter order
request into a buy order and a sell order; and

means for executing the buy order and sell order on an open market exchange.

103. A method operable on a computer for creating a barter order request, the barter

25 order request including at least first and second securities, the first security including a
quantity thereof to be sold in a barter, the second security including a quantity thereof to
be purchased in the barter, and the barter order request further including a date in which
the barter is to occur, the method comprising the steps of:

establishing on the computer a condition for identifying the at least first and

30 second securities; and

establishing on the computer a formula for grouping the at least first and second

securities into a basket of securities.

104. A method in accordance with claim 103 wherein the condition includes at least one variable, at least one arithmetic operator, a comparison operator, and a constant.

5

105. A method in accordance with claim 103 wherein the formula includes filters.

106. A method in accordance with claim 103 wherein the condition is based on at least one of the group including market characteristics and risk characteristics.

10

107. A system operable on a computer for establishing a basket of securities from which to create a barter order request, the barter order request including a first security including a quantity thereof to be sold in a barter, a second security including a quantity thereof to be purchased in the barter, and a date in which the barter is to occur, the system comprising:

means for providing a plurality of selectable conditions, each condition operative to identify a plurality of securities; and

means for creating a formula to define a basket of securities from the plurality of securities, the basket including at least the first and second securities.

20

108. A method in accordance with claim 107 wherein each of the plurality of conditions includes at least one variable, at least one arithmetic operator and a comparison operator.

25

109. A method in accordance with claim 107 wherein the means for creating a formula includes means for establishing filters.

110. A system in accordance with claim 107 further comprises means for including in the barter order request a condition relating to the value of the barter.

30

111. A method operable on a computer for creating a contingent barter order request.

the method comprising the steps o

creating a barter order request including a first security including a quantity thereof to be sold in a barter, a second security including a quantity thereof to be purchased in the barter, a date in which the barter is to occur, and a first condition

5 relating to the value of the barter under which condition the barter is to occur on the date;

creating a contingency including a second condition;

monitoring the second condition; and

automatically submitting the barter order request for processing upon the occurrence of the second condition.

10

112. A method in accordance with claim 111 wherein the step of automatically submitting the barter order request includes transmitting the barter order request to a third party for execution.

15

113. A system for creating a contingent barter order request, the barter order request including a first security including a quantity thereof to be sold in a barter, a second security including a quantity thereof to be purchased in the barter, a date in which the barter is to occur, and a first condition relating to the value of the barter under which condition the barter is to occur on the date; the system comprising:

20

a processor;

a memory connected to the processor and containing instructions operable with the processor to cause the processor to perform the steps of

creating using input data from a user the barter order request;

defining using input data from the user a contingency including a second

25 condition;

monitoring the second condition; and

automatically submitting the barter order request for processing upon the occurrence of the second condition.

30

114. A system in accordance with claim 113 wherein the step of automatically submitting the barter order request includes transmitting the barter order to a third party

for execution.

115. A method in accordance with claim 113 wherein the step of automatically submitting the barter order request includes transmitting the barter order to a third party

5 for a quote response.

116. A method operable on a computer for trading a barter order including a first security to be sold and a second security to be purchased, the method comprising the steps of:

10 receiving on the computer the barter order, the barter order comprising one of the group including a limit order, a market order and a trade from order book;

if the barter order is a limit order, submitting the limit order for execution;

if the barter order is a market order, submitting the market order for execution;

and

15 if the barter order is a trade from order book, providing contra barter offers for consideration.

117. A method in accordance with claim 116 wherein the limit order is expressed as a total dollar limit.

20

118. A method in accordance with claim 117 wherein the total dollar limit is automatically calculated on the computer.

25

119. A method in accordance with claim 116 wherein individual prices are established for at least one of the first and second securities.

30

120. A method in accordance with claim 116 wherein the step of receiving on the computer a barter order is performed using a graphical user interface.

121. A method in accordance with claim 116 wherein, if the barter order is a trade from order, further including the step of completing a trade without specifying a limit

price or a limit or market order stat

122. A method in accordance with claim 116 wherein, if the barter order is a trade from order book, further comprising the step of selecting at least one contra offer for
5 trading.

123. A method in accordance with claim 122 wherein the step of selecting at least one contra offer includes simultaneously selecting a plurality of contra offers.

10 124. A method in accordance with claim 123 and further including the step of automatically receiving the cumulative value of the difference between National and Internal offers.

15 125. A system for trading a barter order including a first security to be sold and a second security to be purchased, comprising:
20 a processor;
a memory connected to the processor and storing the barter order, the barter order comprising one of the group including a limit order, a market order and a trade from order book, the memory further containing instructions for controlling the operation of the processor to perform the steps of

if the barter order is a limit order, submitting the limit order for execution;
if the barter order is a market order, submitting the market order for execution;

and

if the barter order is a trade from order book, providing contra barter offers for
25 consideration.

126. A system in accordance with claim 125 wherein the limit order is expressed as a total dollar limit.

30 127. A system in accordance with claim 126 where the total dollar limit is automatically calculated on the computer.

128. A system in accordance with claim 125 wherein individual prices are established for at least one of the first and second securities.

5 129. A system in accordance with claim 125 wherein the barter order is received into the system using a graphical user interface.

10 130. A system in accordance with claim 125 wherein, if the barter order is a trade from order, further including the step of completing a trade without specifying a limit price or a limit or market order status.

15 131. A system in accordance with claim 125 wherein, if the order is a trade from order book, then further comprising the step of selecting at least one contra offer for trading.

20 132. A system in accordance with claim 131 wherein the step of selecting at least one contra offer includes simultaneously selecting a plurality of contra offers.

133. A method in accordance with claim 132 and further including the step of automatically receiving the cumulative value of the difference between National and Internal offers.

25 134. A method for trading a barter order including a first security to be sold and a second security to be purchased, the method comprising the steps of:
... receiving the barter order, the barter order comprising one of the group including a limit order, a market order and a trade from order book;
... if the barter order is a limit order, submitting the limit order for execution;
... if the barter order is a market order, submitting the market order for execution;
and
... if the barter order is a trade from order book, providing contra barter offers for consideration.

135. A system for trading a barter security comprising a first security to be sold and a second security to be purchased, the system comprising:

means for receiving on the computer the barter order, the barter order comprising one of the group including a limit order, a market order and a trade from order book;

5 means for submitting, if the barter order is a limit order, the limit order for execution;

means for submitting, if the barter order is a market order, the market order for execution; and

means for providing, if the barter order is a trade from order book, contra barter

10 offers for consideration.

Define Order Contingencies

Name:	Conditions:
Techs_up_2	<input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/> [SUNW]Price >= 1.02*[SUNW]Cprice(D-1)
SPX_up_for_day	<input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/> [CSCO]Price >= 1.02*[CSCO]Cprice(D-1)
NDX_crosses_mavg star_on_low	<input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/> [##]Price >= 1.02*[##]Cprice(D-1)
<input type="button" value="New"/> <input type="button" value="Delete"/> <input type="button" value="Add"/> <input type="button" value="Edit"/> <input type="button" value="Remove"/>	
<input type="button" value="OK"/> <input type="button" value="Cancel"/> <input type="button" value="Help"/>	

Figure 21

An order contingency is a set of user-defined conditions that must be satisfied before a "primary" order (i.e., symbol, tick/roll, quantity, market, limit) is executed by giving this group of conditions a name, that will be used when the primary order is created.

To create a new order contingency enter the new name in the top field (order "Name") and click New. The name will be entered in the lower field along with the names of existing order contingencies. To delete an existing order contingency, including both the name and condition, right-click the name in the lower field and click Delete. To edit the conditions, click the name of the order contingency, followed by the name of the condition being typed conditions in the top field (order Conditions).

Conditions of an order contingency are defined using mathematical expressions. The expressions are created by clicking on the condition type (selected in the top field) and then clicking the New button in the Order Contingent Order window. The expressions define the order priority, which is a condition may consist of variables, arithmetic operators, numerical constants, security symbols, and a comparison operator such as "greater than or equal to". Variables can be provided by the system and created by the user. Conditions can be created by clicking the New button in the Order Contingent Order window. These variables can be used in the expressions and accessed through a dropdown menu by pressing **Ctrl** and clicking the **Select Variable** option. Examples of variables are "one-day ago earnings per share", "10-day moving average", "Percent Change in price over last 30 days", and "Market position". User-defined new variables by clicking **New** and **Variable** will automatically appear in the **Block Value / Create Condition**. These user-defined variables can be created and for the specific user-defined benchmarks, set to the condition (Block Value / Create Condition == Current Price). [Click here to learn variable syntax](#).

To create a new condition, type the condition in the top field under "Conditions" and click Add. To modify a condition, highlight the condition in the lower field and click Edit. To delete a condition, highlight the lower field and click Remove.

To save the changes that have been made, click OK. To abort the changes that have been made click **Cancel**.

Help Screen: Fundamental and Technical Filters

Whereas the **Symbolless window** is used to set up sets of known symbols, the **Functional window** and the **Technical filter window** is used to set up sets of symbols with desired qualities, properties and/or characteristics. Each such set is called a **Filter**. The window is partitioned into two sections: (1) **Filter Name** and (2) **Conditions**.

To create and name a new filter, enter the new name in the top field under **filter name** and click **New**. The name will be entered in the lower field along with the names of existing filters. To create an event filter, including both its name and conditions, type in the filter name in the top field and click **filter name**. Click the name in the lower field to define the conditions of the filter as described below.

Conditions of change are used to describe the characteristics of the system's components and all parameters which satisfy all of the stated conditions. To create a rule, select the "Edit" tab, then the "Conditions" tab, and then "New" (the icon located in those filters in the Define Selection window). A condition may consist of variables, arithmetic operations, numerical constants, and a comparison operator, such as greater than or equal to. Variables can be pre-defined by the system, and include large numbers of fundamental, physical, historical, and descriptive characteristics. These variables and their numerical evaluations are selected through a pop-up screen in response to clicking the "Select Variable" button. Examples of variables are "Current Year" (a variable representing 2000 days from until a year), "Percent Change in Price" (a list of rates), and "Shares Outstanding". Users can create new variables by combining system variables with arithmetic operators, as in [Stock Value / Shares Outstanding]. Thus, user-defined expressions can be created and tested against user-defined benchmarks, as in the expression [Stock Value / Shares Outstanding] = Current Price.

To create a new condition type, click condition in the top field under "Conditions" and click "Add". To modify a condition, highlight the condition in the lower field and click "Edit". To delete a condition, highlight it in the lower field and click "Delete".

Once at least one condition has been entered, click the **Define New Symbolic** button to display the symbolic names associated with the data and symbol definitions. These symbols in the list will then be used to create **Symbolic**, **Number** and **Text** **Symbol**. To delete a symbol from the list, click the **Remove** button for that **Symbol**.

To save the changes that have been made, click OK. To ignore the changes that have been made, click Cancel.

Figure 32

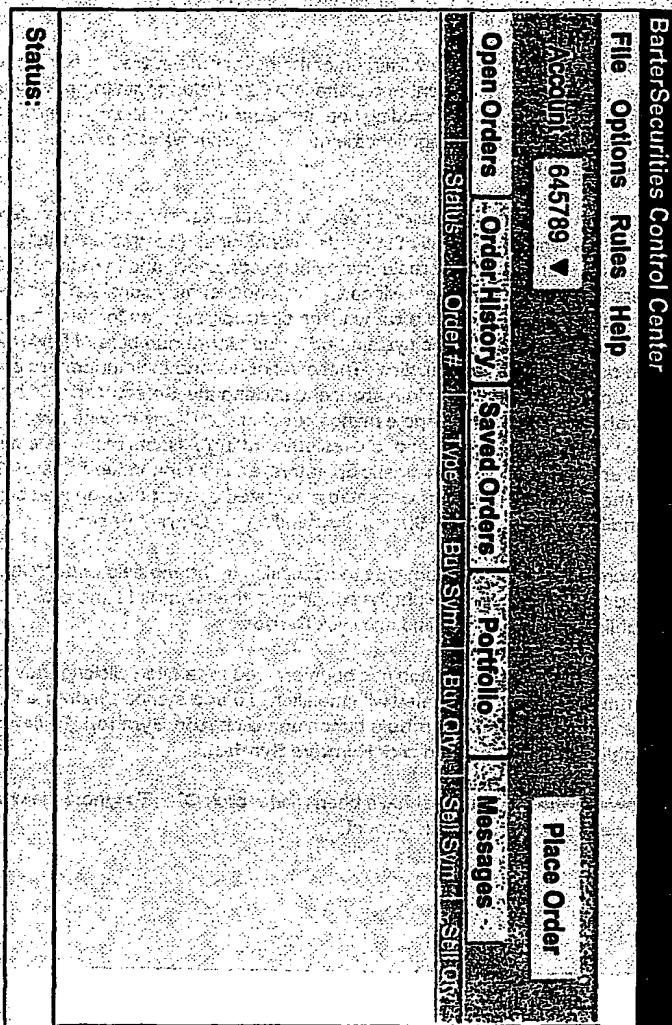

Figure 33

BarterSecurities Control Center

The **Control Center** is the starting point to create and send orders, and to check on trades and positions. Although users may have multiple accounts, the information shown in the **Control Center** applies only to the **Account** designated in the upper left corner.

You may create a new order by clicking the **Place Order** button on the upper right of the screen. Doing so pops up the **Order Entry** screen from which you may (1) save the order for later use, (2) create a **Market** or **Limit** order, or (3) trade directly from the **Limit Order Book** (LOB) for your order.

The **Open Orders** tab shows orders that have been sent and are pending prior to execution. For example, if you submit a limit order that is away from the market and so cannot be traded, it will be shown in this tab. Orders are shown as **Open**, **Filled**, **Out**, **Canceled**, **Part Fill**, **Part Fill-Canceled**, or **Part Fill-Out**. Right-clicking on an order's line brings up a menu which allows you to change or cancel the order. Note that when you trade directly from the LOB, you receive an instantaneous confirmation; hence, your order will not show up in the **Open Orders** tab.

The **Order History** tab summarizes the barter trades that you have made. By default, trades for all symbols are shown. By filling in the appropriate fields, you may choose to limit the viewed barter trades to only those involving one stated symbol, or only those involving two stated symbols in combination. You may also choose to view only those trades within a stated historical time period. By clicking on a column header, you may sort trades in the list according to the column's attribute. (E.g., "symbol" or "Date/Time".)

The **Saved Orders** tab shows all orders that you have saved for delivery in the future. If you saved an order from the **Market Order Entry** or **Limit Order Entry** screens, that fact is indicated in the **Type** column. Double-clicking on one of these orders pops up the respective **Market** or **Limit** screen for modification of the order and/or order delivery. If you saved the original order from the main **Order Entry** screen, then there is no corresponding indicator in the **Saved Orders** tab. Double-clicking on such an order pops up the main **Order Entry** screen from which you can initiate a limit or market order or choose to trade directly from the LOB. Right-clicking on any saved order pops up a menu that allows you to trade the order from the LOB, edit the order, or delete it.

The **Portfolio** tab lets you view your current inventory of long and short securities. Double-clicking on any security's row in this tab pops up the main **Order Entry** screen with the security symbol and quantity filled in to effect a closing trade. For example, if you are short 500 IBM, the **Order Entry** screen would show a buy of 500 IBM. After filling in a buy-side security and quantity, you may submit the order.

Figure 34

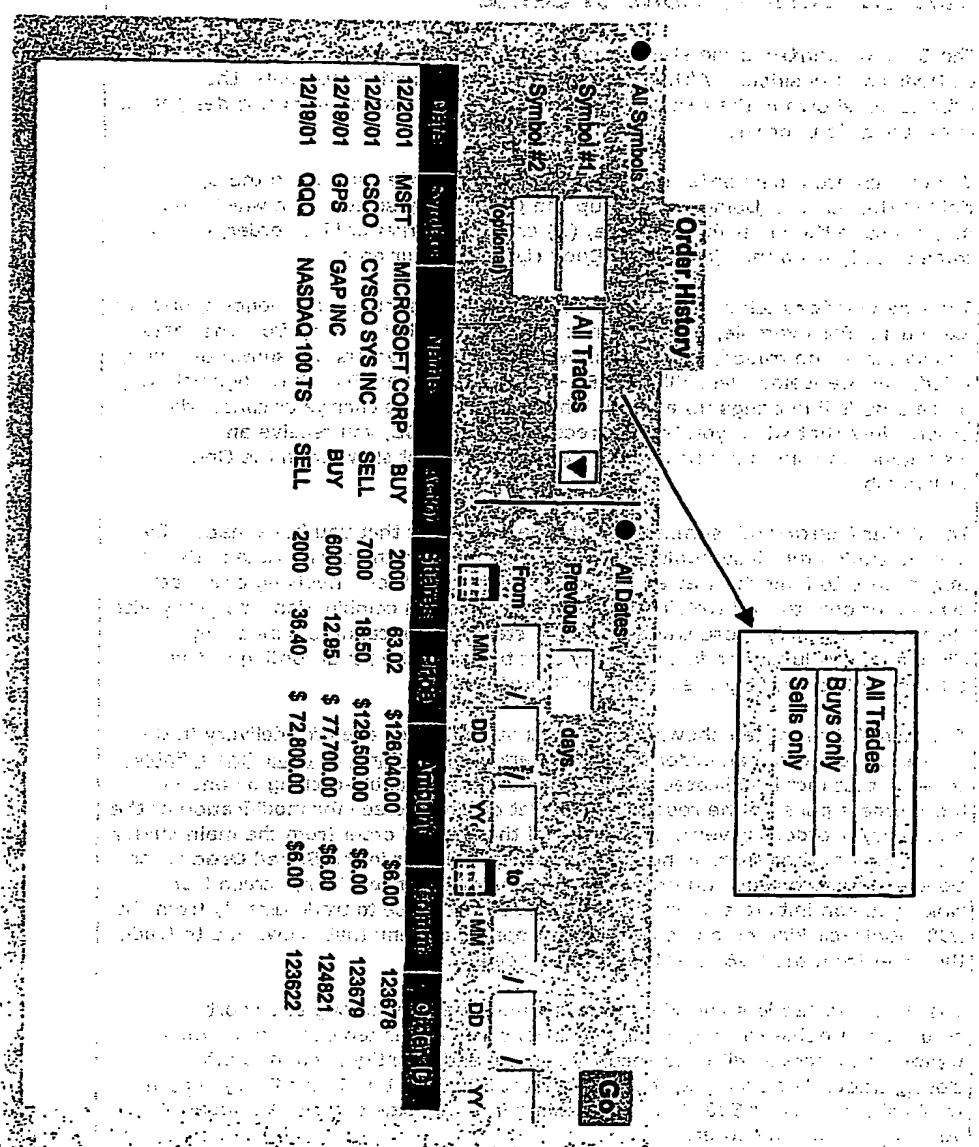

Figure 35

Saved Orders							
Type	Symbol	Quantity	Price	Order Type	Commission	Trade Date	Entered By
LOB	MSFT	BUY 1000	INTC	SELL 2000		12/18/01 13:18	
MKT	CSCO	BUY 6000	SEBL	SELL 4000		12/19/01 13:19	
LIM	MSFT	BUY 1000	CSCO	SELL 3000	PAY \$3,100.50	12/19/01 13:21	
LOB	VRTS	BUY 2000	CSCO	SELL 4000		12/18/01 13:18	

Figure 36

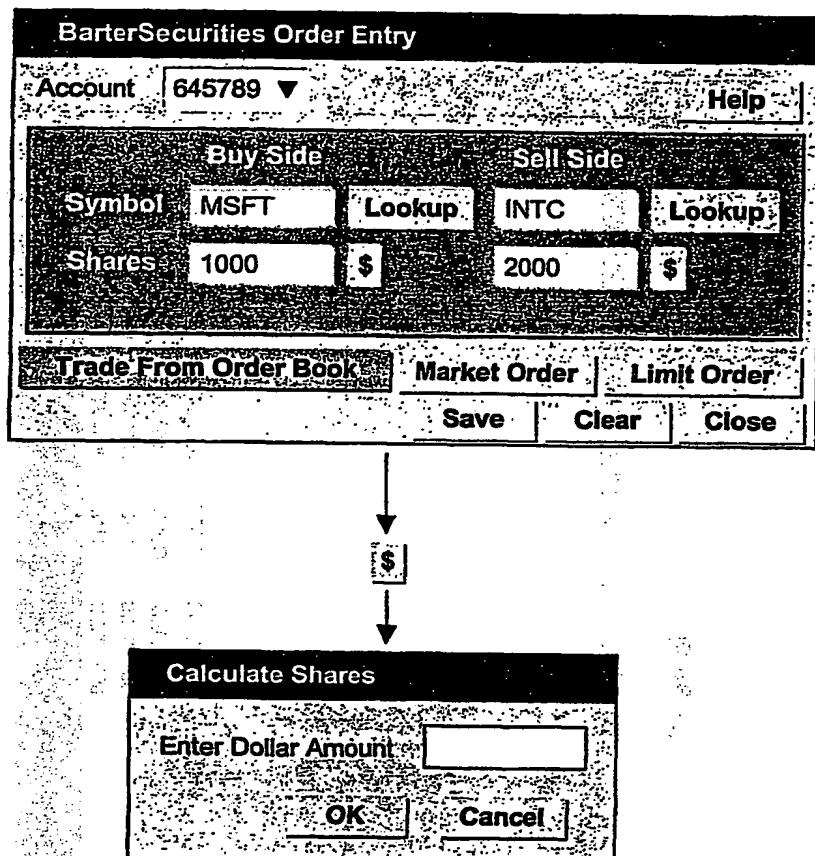

Figure 37

BarterSecurities Order Entry

Bring up the Order Entry screen either by clicking the Place Order button on the BarterSecurities Control Center, or by double-clicking a saved order. To begin to place an order, first make sure the Account number in the upper left of the screen is correct. Then describe your order by filling in just four fields: buy-side symbol, sell-side symbol, buy-side shares and sell-side shares.

If you wish to express quantity in terms of dollars, click the "\$" button next to a Shares field. The Calculate Shares screen pops up in which you can enter the desired number of dollars. Clicking OK transforms the dollars into shares of a security based on the Last Trade price of the security.

Unlike traditional one-sided orders, you don't have to specify limit or market status to trade a barter order unless you prefer to do so. You can trade directly from the Limit Order Book for your order.

Market Orders

To send a market order after you have filled in symbol and quantity information, click **Market Order**. You will be asked whether you would like to attach contingencies to your order. For example, you could send your market order only when the price of your buy-side security touches \$50. To learn more click Market Order entry.

Limit Orders

To send a limit order after you have filled in symbol and quantity information, click **Limit Order**. You will be asked to attach a limit price to your order as well as other optional information. To learn more click Limit Order entry.

Trade from Order Book

To view the current offers for your order, or to trade directly against the existing offers for your order, click **Trade from Order Book** after you have filled in symbol and quantity information on the Order Entry screen. Using the Limit Order Book (LOB) lets you complete a trade without specifying a limit price for your trade and even without specifying Market or Limit status. You can trade on individual offers that are internal to the BarterSecurities system, or you can trade simultaneously with one-click (Quick Fill) on all of the available internal offers up to the quantities that you specified in your incoming order. To learn more about the fastest way to trade your order, click Limit Order Book.

Save Order

To save an order for use later click the **Save** button. The order is saved in the **Saved Orders** tab of the **Control Center**. When you double-click the order in the **Control Center**, your order will pop up in the **Order Entry** screen, from which you can designate a market or limit order, or **Trade from Order Book**. If you wish to save an order along with limit order information, you should click the **Limit Order** button on the **Order Entry** screen, enter the relevant information, and then click the **Save** button on the **Limit Order Entry** screen. The order will still be saved in the **Saved Orders** tab of the **Control Center**, but double-clicking the order will pop up the **Limit Order Entry** screen from which you can modify your information and/or send your order. Likewise for saved market orders.

Figure 38

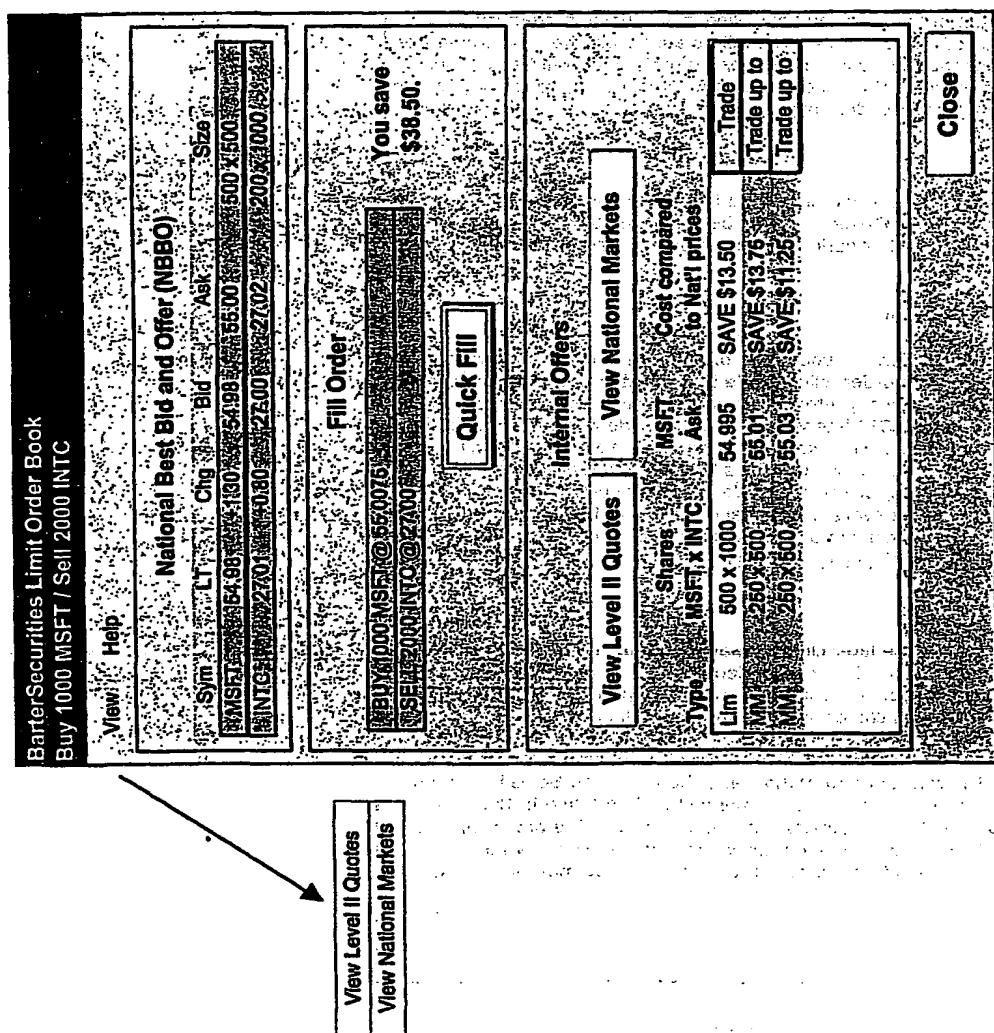

Figure 39

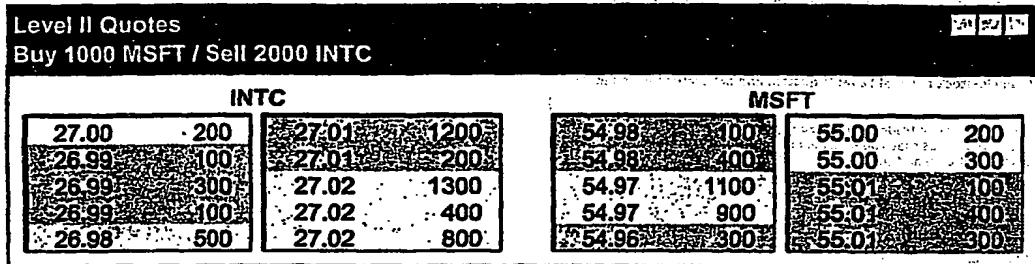

Figure 40

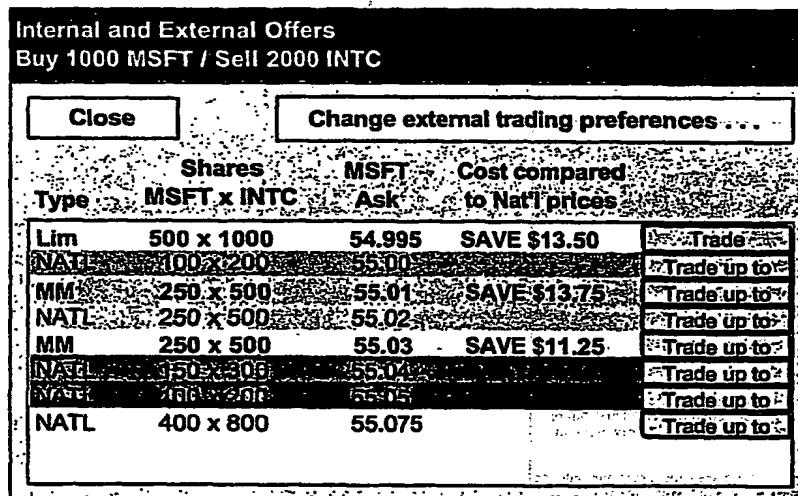

Figure 41

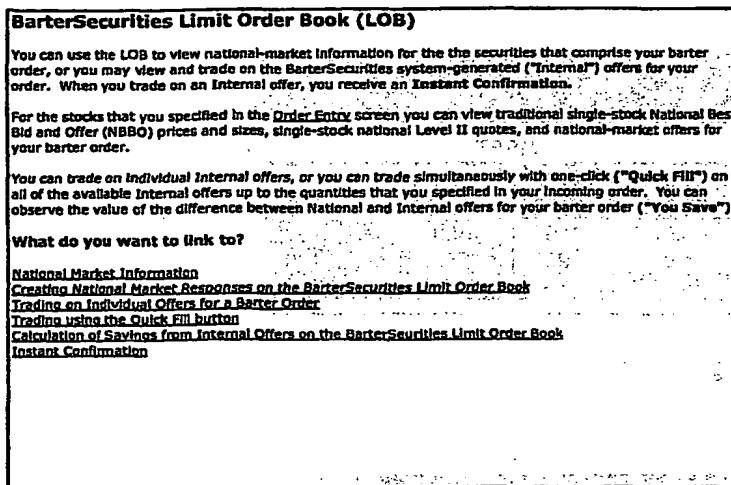

Figure 42

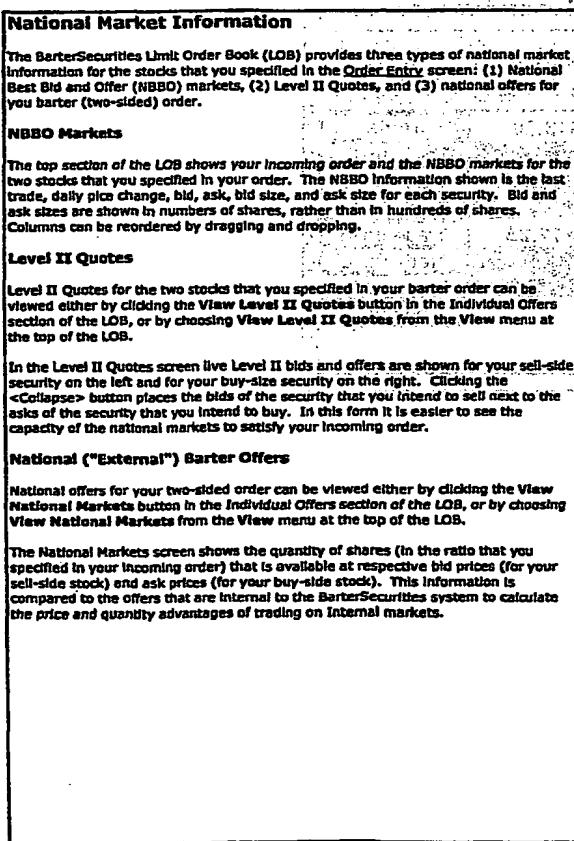

Figure 43

Trading on Individual Offers for a Barter Order

The bottom section of the Limit Order Book (LOB), entitled "Internal Offers", normally shows several offers for the two-sided order that you specified in the Order Entry screen. These offers are internal to the BarterSecurities system; i.e., they are not available in the national markets. The system displays all available internal offers up to a cumulative share quantity equal to the quantities that you specified in Order Entry screen. The offers are ranked from most favorable to least favorable offer price, and they retain the ratio of buy-quantity to sell-quantity that you specified. **IMPORTANT:** All offers are expressed as selling your sell-side security on the current NBBO bid price and buying your buy-side security at the variable Ask price shown.

The data displayed for each internal offer are (1) a barter quantity expressed in actual (not hundreds of) shares, (2) a sell-side security bid price (i.e., the current NBBO bid), (3) a buy-side security ask price (used to rank the offers) and (4) a dollar amount of savings relative to executing your order on the national markets. See how Savings is computed.

Next to the most attractive offer is a **Trade** button and next to each subsequent offer is a "Trade up to" button. Clicking on one of these buttons generates an instantaneous trade report at the quantities and prices currently displayed. If a trader clicks a "Trade up to" button, then the indicated offer and all more attractive offers are sent for execution. **NOTE:** Traders must exercise care if displayed offers are changing rapidly.

A Save amount less than zero means that it may be more expensive to execute your order internally (i.e., on the BarterSecurities system) than on a national market. However, the BarterSecurities system has these advantages: (1) your order confirmation is immediate, (2) your specified security quantity ratio is preserved, and (3) the internal quantity depth offered may be greater than on the national market.

Figure 44

Trading using the Quick Fill button

The middle section of the Limit Order Book (LOB), entitled "Fill Order", provides a convenient way to view the aggregation of the Individual Offers shown in the bottom section of the LOB. The Quick Fill offer is designed to fill your incoming order, provided that enough individual offers exist to do so. The Quick Fill quantity is the sum of the available individual offer quantities up to the size of your incoming order. The Quick Fill sell-side price is that security's current NBBO bid and the buy-side price is the quantity-weighted average of the individual offer buy-side ask prices.

The data displayed for the Quick Fill offer are (1) buy- and sell-side quantities expressed in actual (not hundreds of) shares, (2) the sell-side security bid price (i.e., its current NBBO bid), (3) a buy-side security ask price and (4) a dollar amount of savings relative to trading the Quick Fill quantities on the national markets. See how Savings is computed.

To trade against the Quick Fill offer, just click the **Quick Fill** button. Doing so generates an Instantaneous trade report at the quantities and prices currently displayed. **NOTE:** Traders must exercise care if displayed offers are changing rapidly.

Quick Fill savings less than zero means that it may be more expensive to execute your order internally (i.e., on the BarterSecurites system) than on a national market. However, the BarterSecurites system has these advantages: (1) your order confirmation is immediate, (2) your specified security quantity ratio is preserved, and (3) the internal quantity depth offered may be greater than on the national market.

Figure 45

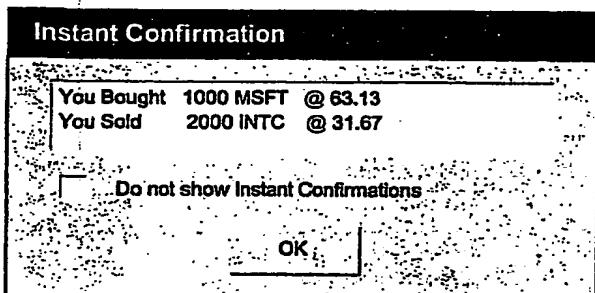

Figure 46

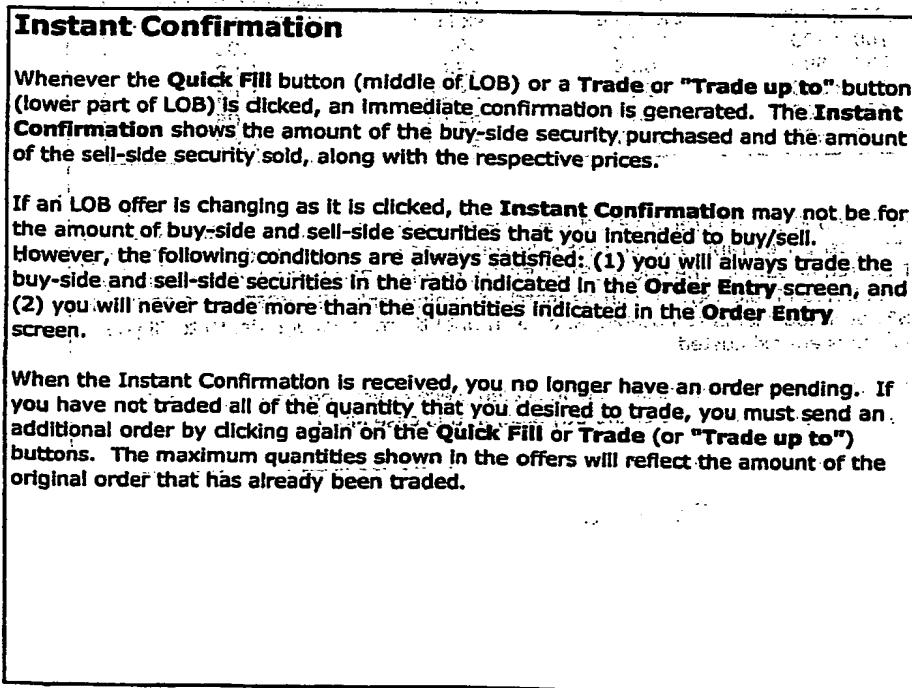

Figure 47

Creating National Market Responses on the BarterSecurities Limit Order Book

To illustrate how national offers for a barter order are calculated, suppose you have just submitted the order:

BUY 1000 MSFT / SELL 2000 INTC.

Also assume that the national order books for INTC on the bid side and MSFT on the ask side are as shown in Tables 1A and 1B.

Table 1A
INTC: National Bids

Bid Price	Bid Size
27.00	200
26.99	500
26.98	500
26.97	1000

Table 1B
MSFT: National Asks

Ask Price	Ask Size
55.00	500
55.01	1000

Offer prices for your order (executed in a 2-1 ratio) as derived from the national markets for the single stocks, are shown in Table 2 in order of best to worst offer.

Table 2
National Offers for your Barter Order
Buy 1000 MSFT / Sell 2000 INTC

Row Number	Size (MSFT x INTC)	INTC Bid Price	MSFT Ask Price	Barter Offer Price (MSFT - 2 x INTC)
1	100 x 200	27.00	55.00	1.00
2	250 x 500	26.99	55.00	1.02
3	150 x 300	26.98	55.00	1.04
4	100 x 200	26.98	55.01	1.05
5	400 x 800	26.97	55.01	1.07

Based on the best MSFT offer of 500 shares (Table 1B), the system looks for 1000 shares on the INTC side. It finds only 200 INTC at the best price (Table 1A), so that only 100 MSFT can be matched with it (Table 2, row 1), leaving 400 MSFT offered at 55.00. The 400 MSFT at 55.00, requires 800 INTC, but there is only 500 INTC at the next price of 26.99 (Table 1A). It can be matched against only 250 MSFT at 55.00 (Table 2, row 2), leaving 150 MSFT at 55.00 that is still usable, and so on until there is enough depth to fill your order, or until the national books are exhausted.

In Table 2, the Barter Offer Price is the cost of trading the indicated piece of your order at each row's prices and sizes, and is expressed per 100 shares of the buy side, in this case MSFT.

Figure 48

Calculation of Savings from Internal Offers on the BarterSecurities Limit Order Book

Trading on the BarterSecurities system saves you money relative to the national markets. An illustration of this is given below.

Suppose you have just submitted the order:

BUY 1000 MSFT / SELL 2000 INTC.

Also suppose that the national market offers for your order are as is shown in Table 1 (see separate sheet). To see how these offers were calculated, [click here](#).

[Table 1]

Often, there are additional offers that are internal to the BarterSecurities system that will improve national markets by providing either more favorable execution prices, by providing a greater quantity to trade, or both. Certain offers may originate with professional marketmakers. Other internal offers may arise due to outstanding limit orders, either alone or in combination. For example, a limit order to buy INTC and sell CSCO, and a second order to buy CSCO and sell MSFT, may create an "implied" offer for an incoming barter order to buy MSFT and sell INTC. To learn more, see Order Matching.

Suppose that one marketmaker is willing to respond to your barter order by simultaneously buying 1000 INTC at 27.00 and selling 500 MSFT at 55.00, and that a second marketmaker is willing simultaneously to buy 1000 INTC at 26.99 and sell 500 MSFT at 55.01. In the form of the previous table, the marketmaker offers are expressed below.

Size (MSFT x INTC)	INTC Bid Price	MSFT Ask Price	Barter Offer Price (MSFT - 2 x INTC)
500 x 1000	27.00	55.00	1.00
500 x 1000	26.99	55.01	1.03

The offer prices for your barter order, updated to include the marketmaker offers, are shown in Table 2 (see separate sheet). Note that the second marketmaker's internal response is split into two rows (#4 and #5) because only the first row of the two is necessary to fill your order of 2000 INTC, 1000 MSFT.

[Table 2]

The introduction of internal offers represents savings to you, the customer. To compute these savings, which are shown in Table 3, the system compares the internal offers to the offers that would have been available for those same shares in the national markets. In Table 3 (see separate sheet) the first row shows that the first

[Table 3]

Internal offer of 500 shares (Table 2, row 2) takes the place of three national offers of varying share amounts (Table 2, rows 1, 3, and 6). That is, an offer of 1.00 replaces three national offers of 1.00, 1.02, and 1.04. The weighted national offer is 1.022 (i.e., $\$1.00 \times 100 + \$1.02 \times 250 + \$1.04 \times 150$), so the savings is \$11.00 (500 x \$0.022). Similarly, the internal offer of 1.03 (Table 2, rows 4 and 5) would have been traded at 1.05 and 1.07 in the national market (Table 2, rows 7 and 8), implying a savings of \$18.00 ($\$0.02 \times 100 + \0.04×400) on the BarterSecurities internal side. The total savings for your complete order is \$29.00.

Figure 49

Total					\$29.00

Figure 50

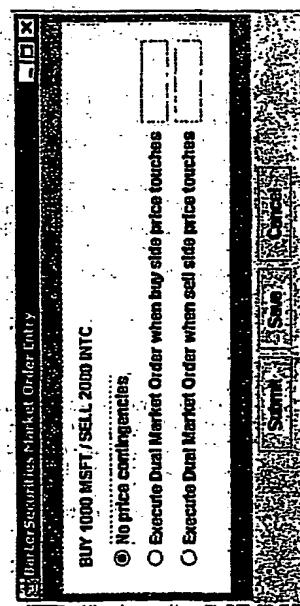

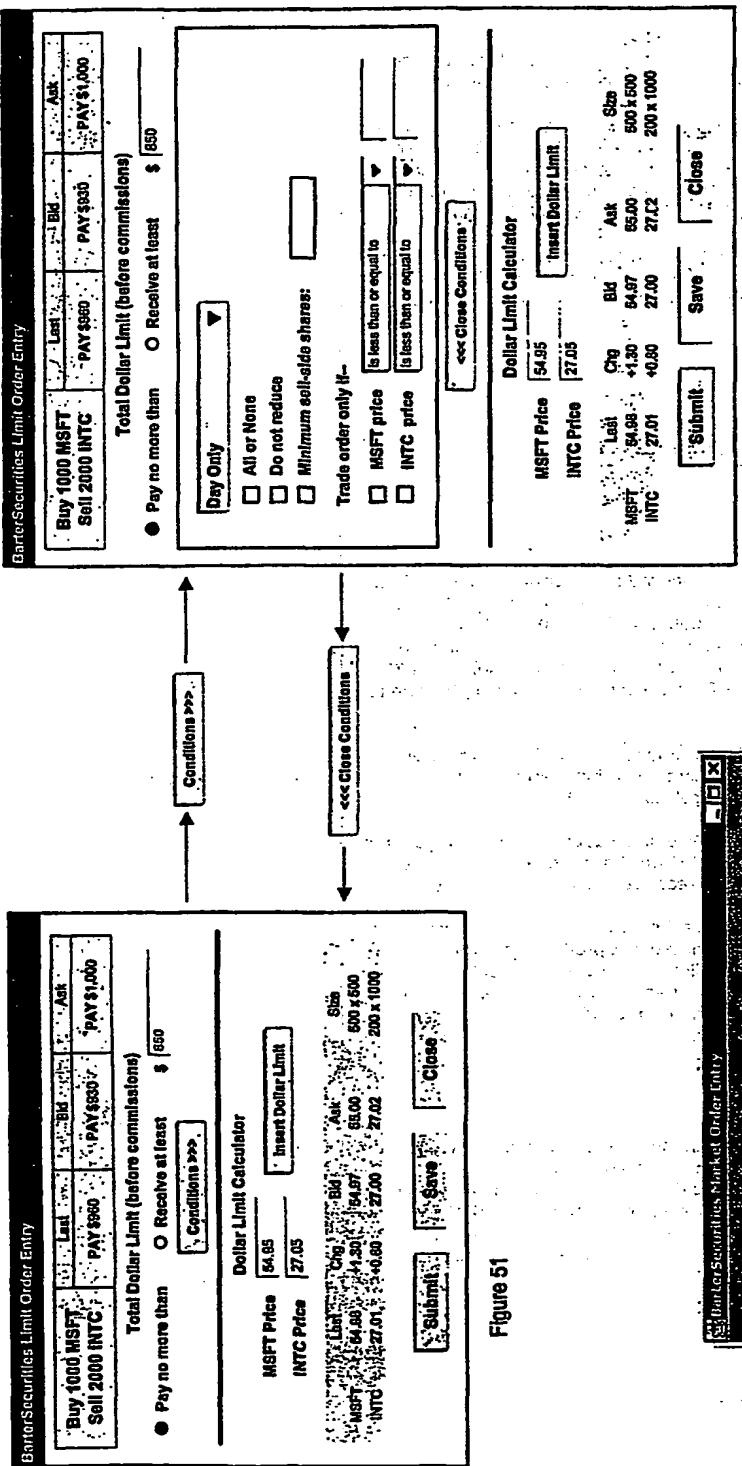

Figure 51

Figure 52

Limit and Market Orders

Limit Orders

Usually, limit prices for a barter order are expressed in terms of a Total Dollar Limit for the order as a whole, rather than in terms of per-share limit prices for individual securities.

Consider the barter order to Buy 1000 MSFT and Sell 2000 INTC. Suppose a trader wants to net from this order the same amount as if MSFT traded at \$50 and INTC traded at \$26. This is equivalent to receiving \$2000; i.e., $[2,000 \times \$26 - 1,000 \times \$50]$. By setting the Total Dollar Limit to "Receive at least \$2000", the trader allows the trade to execute at any combination of per-share prices that satisfy the limit, such as $(\$50/\$26)$, $(\$52/\$27)$, $(\$49/\$25.50)$, etc.

The Total Dollar "current market" is shown in the upper right corner of the Limit Order Entry screen under the headers Last, Bid, and Ask. These values are based on the markets in the individual securities shown at the bottom of the screen. Suppose the current single-stock markets are:

	Last	Bid	Ask
MSFT	54.98	54.97	55.00
INTC	27.01	27.00	27.02

Then, as explained below, the Total Dollar spread of a barter order, BUY 1000 MSFT / SELL 2000 INTC would be:

Last	Bid	Ask
PAY \$960	PAY \$930	PAY \$1000

The Total Dollar "Last" is based on the "Last" prices of the individual securities. That is, "PAY \$960" = $+1000 \times 54.98 - 2000 \times 27.01$. The Total Dollar Bid is based on buying MSFT on its bid and selling INTC on its ask.; i.e., "PAY \$930" = $+1000 \times 54.97 - 2000 \times 27.02$. Normally you would not be able to trade at these prices immediately, but marketmakers might be able to do so. The Total Dollar Ask is based on buying MSFT on its ask and selling INTC on its bid; i.e., "PAY \$1,000" = $+1000 \times 55.00 - 2000 \times 27.00$. Normally you would be able to trade at these prices immediately.

Thus, a Total Dollar Limit of "Pay no more than \$850", is \$150 more favorable to you than the value at which you can trade immediately, and it is \$80 more favorable than the value at which marketmakers might be able to trade your order for themselves.

If you prefer to think about your Total Dollar Limit in terms of individual stock prices, you may use the **Dollar Limit Calculator** in the middle of the Limit Order Entry Screen. Enter two share prices and click the **Insert Dollar Limit** button to create your Total Dollar Limit.

Setting a Total Dollar Limit can produce the same dollar results for a barter order as setting per-share limits, but it is less restrictive. It is recommended because it produces a greater probability of getting a barter order executed. Per-share limits should be used only if you are sensitive to the trade price of one of the legs of the order. If you do wish to set a per-share limit price for one or both securities in your barter order click on **Conditions>>>**. An additional segment of the Limit Order Entry screen appears, which allows you to set per-share limit prices and to set timing and other options for your order.

Market Orders

The default market order is "No price contingencies", which means that your order will be delivered as soon as you submit and confirm it. Alternatively, you may place a per-share price contingency on the **delivery** of the order. Upon submitting the order the system will ask you to confirm your order currently, but the order will not be delivered to the market until the indicated price contingency is satisfied. If and when the order is delivered to the market, it will behave like two traditional market orders: one for the buy leg and one for the sell leg.

Figure 53

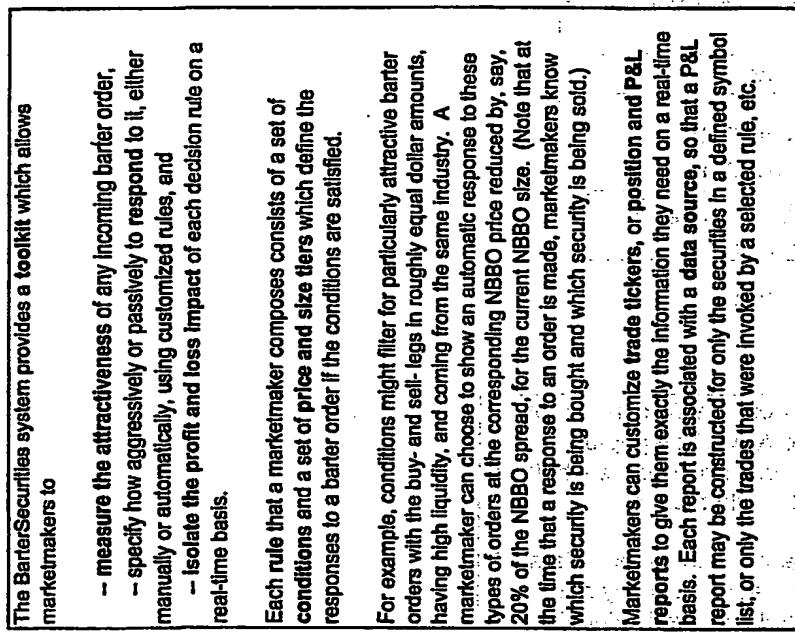

Figure 55

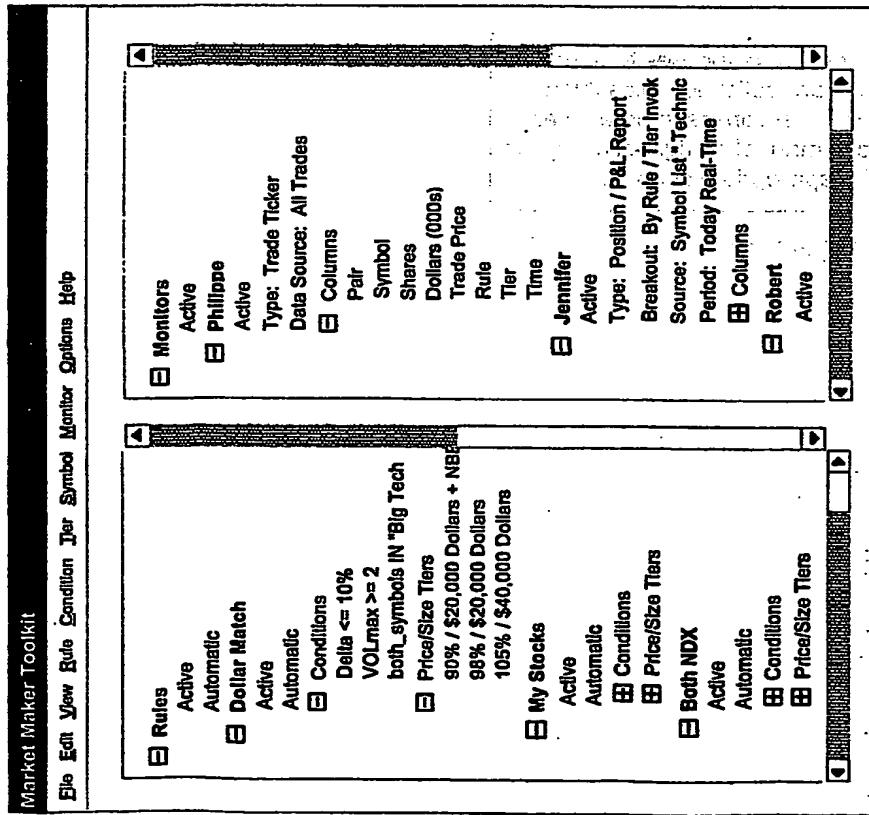

Figure 54

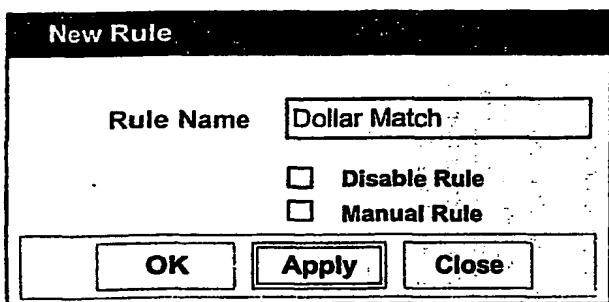

Figure 56

To create a rule, select **New...** from the **Rule** menu of the Marketmaker Toolkit. In the **New Rule** pop-up screen, enter the name of your rule, and choose whether to disable the rule or to make the rule manual.

Only Active rules are used to respond to barter orders. A rule can be activated or disabled at any time by right-clicking the rule name in the Toolkit and selecting the appropriate attribute. Disabled rules are dimmed in the Toolkit window.

All active rules produce automatic responses to barter orders if the rule's conditions are satisfied, unless you choose to respond manually. Responses to orders can be toggled from automatic to manual by right-clicking the rule name and selecting the appropriate attribute.

Figure 57

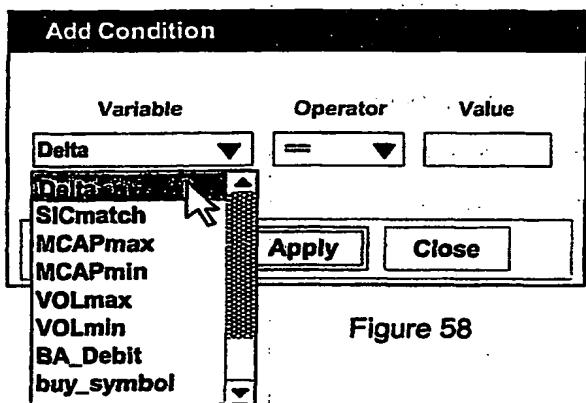

Figure 58

To create a set of conditions for a rule first click on the rule to select it. Then select New... from the Condition menu. In the Add Condition pop-up screen, choose a Variable and an Operator and enter a Value to define the condition.

Variables are keywords that define characteristics of the barter order such as (1) closeness of the buy-side and sell-side dollar amounts, (2) industry closeness of the two legs, (3) volumes, (4) market capitalizations, etc. Additionally, marketmakers can use variables to test for inclusion in default symbol lists, such as the S&P500, or in symbol lists that they define using the Symbol menu in the Toolkit.

Operators are usually equality and inequality signs, but change to <IN> and <NOT IN> when a variable is testing for inclusion in a symbol list.

An example of a condition is:

Delta < 10%,

where Delta is a measure of the closeness of the buy-side and sell-side dollar amounts. A delta of 10% means that the dollar amounts of the two barter order legs differ by 10% of the greater amount.

Another example of a condition is:

buy_symbol IN "Big Tech",

where "Big Tech" is the name of a symbol list that the user has defined.

Figure 59

Definitions of Variables and Allowable Value Ranges.		
<u>Examples</u>		
Variable	Definition	Range (units)
Delta	$\text{abs}(\$long - \$short) / (\text{max}(\$long, \$short))$	0-100%
SICmatch	Number of SIC code digits of buy and sell that match, starting from left.	0,1,2,3,4
MCAPmax	Market Cap of larger-cap stock	(\$bil)
MCAPmin	Market Cap of smaller-cap stock	
VOLmax	Avg Daily \$-volume traded, last 30 days, of more-active stock.	(\$mil)
VOLmin	Avg Daily \$-volume traded, last 30 days, of less-active stock.	
BA_Debit	Debit value of bid/ask spread of Barter Order on NYSE and Nasdaq inside prices.	(Dollars)
The following variables are used to check for inclusion in a Symbol List.		
buy_symbol	Symbol of the incoming order's buy-side security.	(List Name)
sell_symbol	Symbol of the incoming order's sell-side security.	(List Name)
both_symbols	The set of two incoming security symbols.	(List Name)
one_symbol	At least one of the incoming security symbols.	(List Name)
The following variables are used to query a marketmaker's portfolio status.		
Inventory_Buy_Shs	The number of shares of the incoming sell-side security (i.e., the MM is buying) currently in the MM portfolio.	(Shares)
Inventory_Sell_Shs	The number of shares of the incoming buy-side security (i.e., the MM is selling) currently in the MM portfolio.	(Shares)
Inventory_Buy_Val	The dollar value of the incoming sell-side security (i.e., the MM is buying) currently in the MM portfolio.	(Dollars)
Inventory_Sell_Val	The dollar value of the incoming buy-side security (i.e., the MM is selling) currently in the MM portfolio.	(Dollars)

Figure 60

Examples of Variable usage.

'Delta' measures the dollar amount of exposure of the Barter Order. If the retail trader's buy side debit is \$100,000 and the sell side credit is \$75,000, the delta is
 $25\% = |100000 - 75000| / \max(100000, 75000)$.

'SICmatch' shows how industry-related two stocks are. Matched digits are counted from the left until a match fails, after which remaining digits do not count.

SIC #1	SIC #2	SICmatch
4013	4031	2
2631	4031	0.

MCAPmax and MCAPmin measure market capitalization of the bigger and smaller stock, respectively. To ensure that both stocks' market cap exceeds \$1 billion, enter "MCAPmin >= 1". To ensure that at least one stock's market cap exceeds \$10 billion, enter "MCAPmax >= 10".

VOLmax and VOLmin measure the dollar volume of the more- and less-active stock, respectively. To ensure that both stocks trade at least \$2 million per day, on average, enter "VOLmin >= 2". To identify trades in which neither stock trades more than \$2 million per day, on average, enter "VOLmax <= 2".

BA_Debit is the dollar width of a Barter Order on the NBBO market. If a retail trader wishes to buy 100 ABC on the NBBO market 50-50.25 and sell 300 XYZ on the NBBO market 20-20.10, then the dollar size of the spread is \$55, or $100 \times 0.25 + 300 \times 0.10$.

'Symbol' variables allow the marketmaker to identify whether stock symbols fall in marketmaker-created lists. Suppose the marketmaker sets the symbol list below:

List_1: IBM, CPQ, DELL, SUNW, HWP

To ensure that at least one of the Barter Order symbols falls in the list, enter
one_symbol IN List_1.

To ensure that neither Barter Order symbol falls in the list, enter
both_symbols NOT IN List_1.

Use "Inventory" variables to test a marketmaker's portfolio. To test whether a portfolio is short the security that the marketmaker is buying, enter
inventory_buy_shs < 0.

cents per share	<input type="button" value="▼"/>												

Use Price/Size Tiers to create a set of responses to barter orders that satisfy the conditions of a certain rule.

To create the response tiers first click on a rule to select it. Then select **New...** from the **Tier** menu. In the **Add Price/Size Tier** pop-up screen choose an **Offer Price** and an **Offer Size**. (A marketmaker response to a barter order is referred to as an "offer", although both a single-stock bid and a single-stock offer are implied. At the time that the offer is made, a marketmaker knows which security is being bought and which is being sold.)

An offer price may be expressed as a percentage of the current National Best Bid and Offer (NBBO) spread; in incremental cents per share, or as the greater or lesser of those two quantities. For example, suppose an incoming barter order is:

Buy 1000 ABCD
Sell 2000 WXYZ.

and suppose the NBBO markets are:

Bid	Offer
ABCD	52.02
WXYZ	24.01
	24.03.

The NBBO dollar spread for the barter order is \$70.00; i.e., 1000 * 0.03 + 2000 * 0.02. Therefore, a barter offer price of 90% implies a spread of \$63.00. A marketmaker who offers at 90% would be willing simultaneously to buy WXYZ on the bid and sell ABCD at 52.043. ($\$63 = 1000 * 0.023 + 2000 * 0.02$.)

An offer size is expressed either in shares or dollars. either alone or in addition to the current NBBO depth. An offer size of \$20,000 means that each leg of a barter order may be traded up to that amount.

Marketmakers can attach any number of price/size tiers to a given rule.

Figure 68

A Position and P&L Report (PPL) shows the cumulative share and/or dollar inventory along with profit & loss calculations, for all of the marketmaker's automatic and manual trades. Multiple PPLs may be created and viewed simultaneously. The information in these reports may be grouped ("Report Breakout") as the user desires, and the trades which comprise these reports may be a chosen subset ("Data Source") of all trades.

For example, the user may have P&L grouped and summarized by security symbol, or according to the trading decision rule or rule/tier combination which invoked each trade. The data source can be a subset of stock symbols (designated by a Symbol List name), or it can be all trades invoked by a Marketmaker Toolkit rule or rule/tier combination. Therefore, marketmakers can monitor on a real-time basis the profit and loss contribution of each decision rule and price/size tier that they create. This gives them incredible insight into the productivity of their rules and allows them to improve profitability over time.

Share and dollar inventories of securities, and realized, unrealized, and total P&L's can be generated either on a real-time basis or for historical periods. Report Columns can be chosen, modified, and moved as they are for Trade Tickers.

Any row in a Position and P&L Report can be right-clicked to generate a new report of individual trades that comprise the row.

Figure 71

BarterSecurities Request for Manual Offer

The BarterSecurities Marketmaker Toolkit lets you define rules that automatically generate one or more offers on the Limit Offer Book for an incoming barter order when predefined conditions are met. However, you may specify in the rule that when the stated conditions are met, you are to be alerted so that you can make a manual response to the order rather than having offers generated automatically.

When the BarterSecurities Request for Manual Offer screen appears, you can review the incoming order and then (1) deliver an offer according to the price and size defaults that you set, (2) deliver an offer after modifying the price and/or size defaults, (3) close the screen manually without delivering an offer, or (4) let the screen close automatically, after a stipulated number of seconds, without delivering an offer. *Note that as long as the countdown clock is running, the sender of the incoming order will be aware that a manual offer is pending and may be delivered.*

The BarterSecurities Request for Manual Offer screen is partitioned into four sections from top to bottom: (1) Incoming Order, (2) Offer Size, (3) Offer Price, and (4) Action.

Incoming Order

On the left is the incoming order expressed as it was entered; that is, *the marketmaker may take the other side of the trade*. In the following discussion, the term "buy-side" ("sell-side") refers to the security that the sender is buying (selling) and that the marketmaker may sell (buy). The dollar values of both the buy-side and sell-side securities are shown, along with the Delta of the trade. The smaller the delta, the closer together are the buy-side and sell-side dollar values. A delta of zero implies that the dollar values match. A delta of one implies that the barter order is almost one-sided.

The marketmaker may click the **View Level II** button to view real-time Level II quotes for the buy- and sell-side securities. The marketmaker may click the **Modify Defaults** button to change how the default Offer Size and Offer Prices are determined when the Request for Manual Offer screen pops up.

Offer Size

An offer size for the incoming barter order is calculated based on either (1) the price/size tiers stipulated in the Marketmaker Toolkit, or (2) the defaults that you specify in the **Edit Manual Offer Defaults** screen. The quantities in the offer size are always in the same ratio as the quantities in the incoming order. If you wish, you may change the initial size by (1) clicking the size increment/decrement buttons, (2) by typing in a new size in the buy-side or sell-side fields (the opposite size is changed to retain the incoming share ratio), or (3) clicking the **Full Size** button, which causes the offer size to become the same as the incoming order size.

Offer Price

An offer price for the incoming barter order is calculated based on either (1) the price/size tiers stipulated in the Marketmaker Toolkit, or (2) the defaults that you specify in the **Edit Manual Offer Defaults** screen. If you wish, you may change the initial offer price by (1) clicking the price increment/decrement buttons, or (2) by typing in a new value in the available field.

Action

At any time, you may (1) click the green **Offer** button to send your offer as stated, (2) click the red **Cancel** button to close the screen without sending an offer, or (3) click the **Stop** button to stop the rundown clock. If you make none of these actions, the screen will close automatically when the clock has run down to zero.
